Mechanism for computer to learn from data

- Define a function to be learned: $y^n = f(x^n)$
- Define a loss function $\mathcal{L}(f)$ to describe the error between y^n and $\hat{y}^n$
- Find the optimal parameters that minimize $\mathcal{L}(f)$

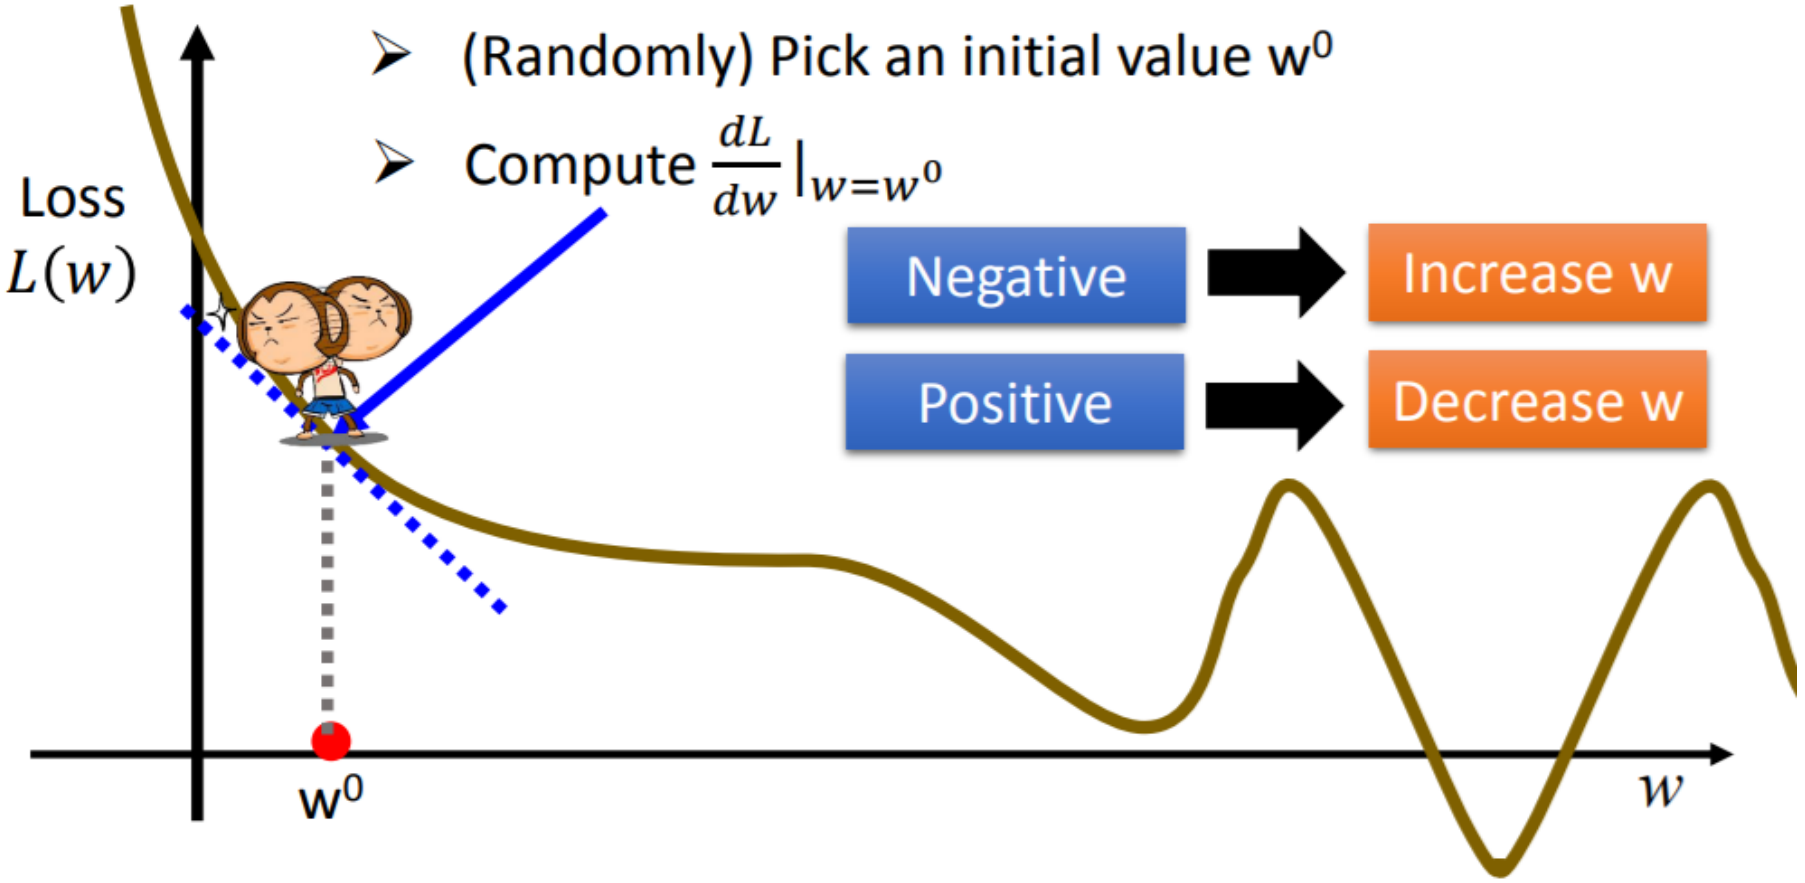
ML model (1) – Linear regression

- Linear model: $y^n = \sum_i (w_i x_i^n) + b$
- Loss function: $L(w,b) = \sum_{n=1}^{N} (\hat{y}^n - y^n)^2 = \sum_{n=1}^{N} (\hat{y}^n - (\sum_i (w_i x_i^n) + b))^2$
- Find the optimal parameters that minimize loss: $\arg \min_{w,\, b} L(w,b)$

Use gradient decent to find optimal parameters

$$w^* = arg \min_w L(w)$$

- Consider loss function $L(w)$ with one parameter w:
  - (Randomly) Pick an initial value w^0
  - Compute $\frac{dL}{dw}|_{w=w^0}$

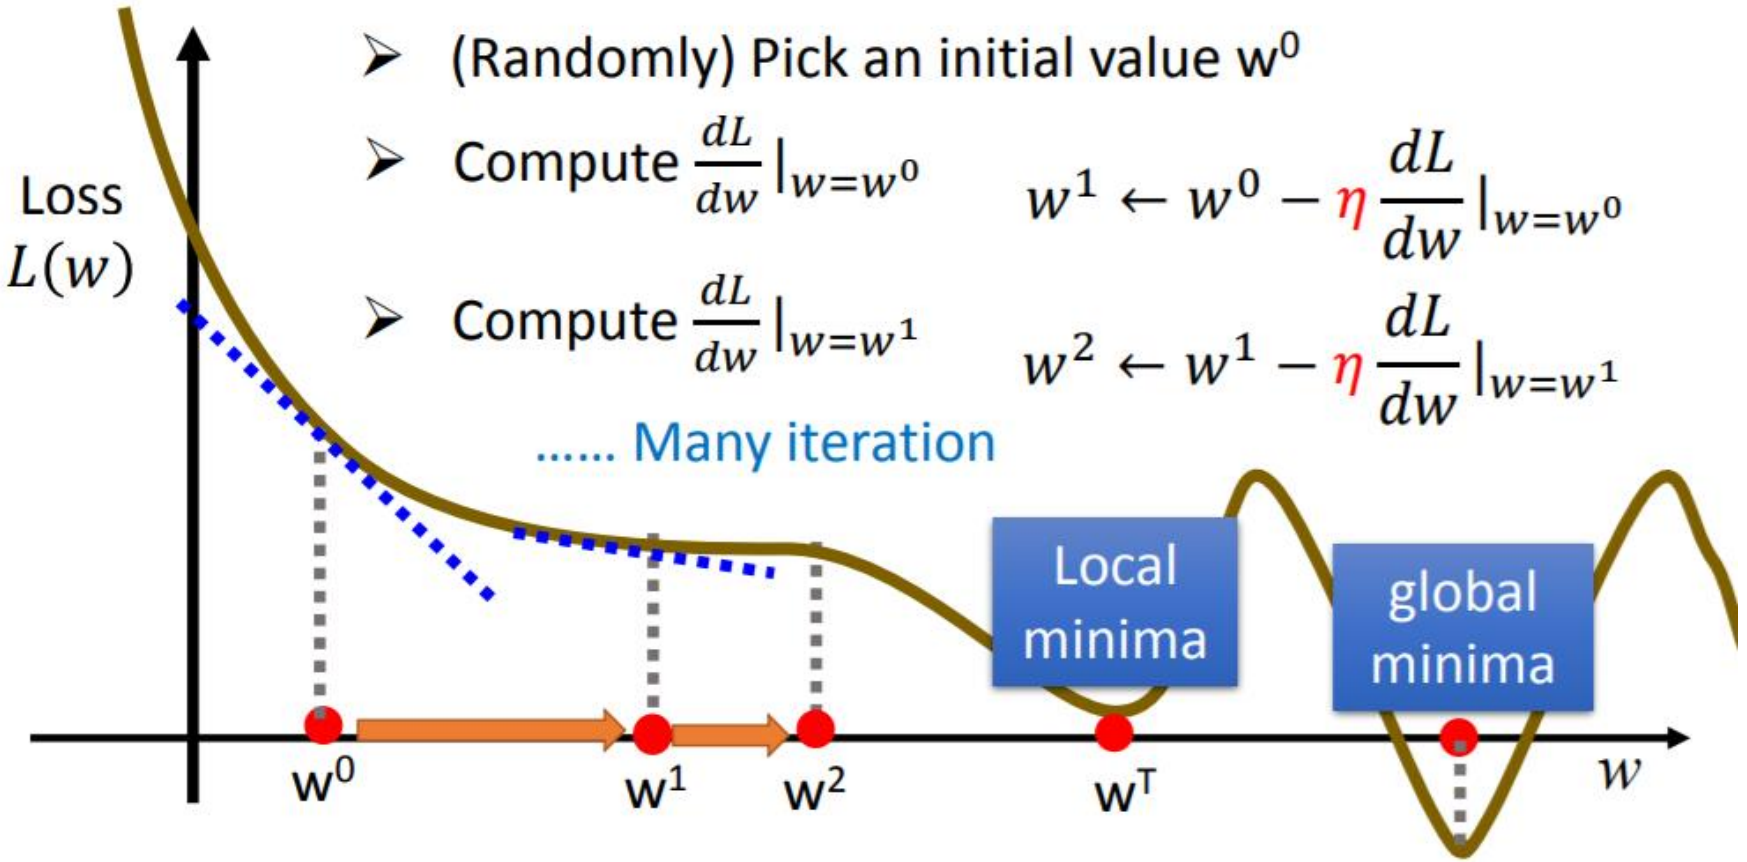


Reference: 李弘毅 ML Lecture 1 https://youtu.be/CXgbekl66jc

Gradient decent

$$w^* = arg\min_w L(w)$$

- Consider loss function $L(w)$ with one parameter w:



Reference: 李弘毅 ML Lecture 1 https://youtu.be/CXgbekl66jc

Gradient decent to find two parameters w^* and b^*

- How about two parameters? $w^*, b^* = arg \min_{w,b} L(w,b)$
  - (Randomly) Pick an initial value w^0, b^0
  - Compute $\frac{\partial L}{\partial w}|_{w=w^0,b=b^0}$, $\frac{\partial L}{\partial b}|_{w=w^0,b=b^0}$

$$\begin{bmatrix} \frac{\partial L}{\partial w} \\ \frac{\partial L}{\partial b} \end{bmatrix}$$ gradient

$$w^1 \leftarrow w^0 - \eta \frac{\partial L}{\partial w}|_{w=w^0,b=b^0} \qquad b^1 \leftarrow b^0 - \eta \frac{\partial L}{\partial b}|_{w=w^0,b=b^0}$$

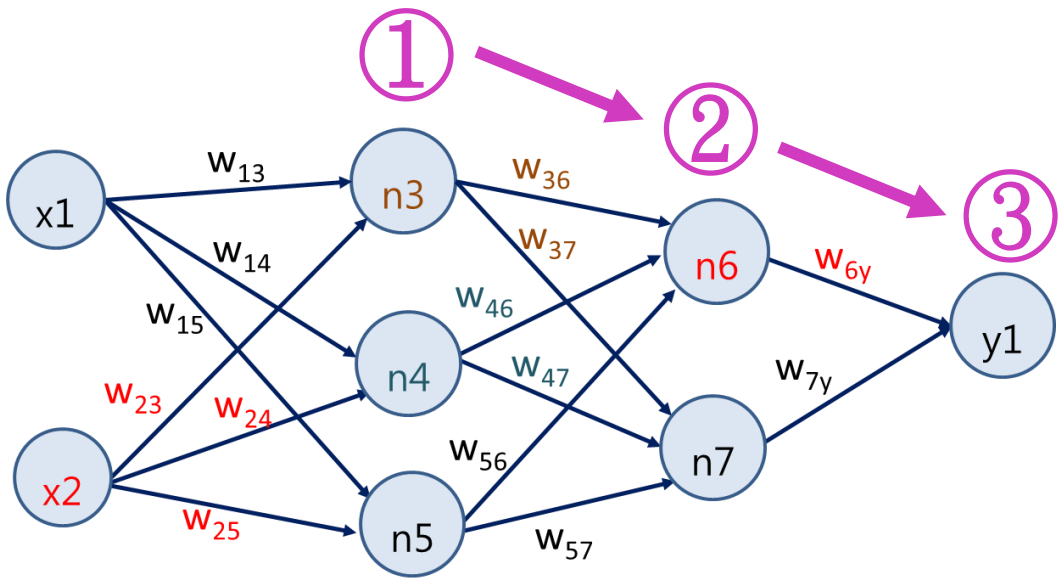
  - Compute $\frac{\partial L}{\partial w}|_{w=w^1,b=b^1}$, $\frac{\partial L}{\partial b}|_{w=w^1,b=b^1}$

$$w^2 \leftarrow w^1 - \eta \frac{\partial L}{\partial w}|_{w=w^1,b=b^1} \qquad b^2 \leftarrow b^1 - \eta \frac{\partial L}{\partial b}|_{w=w^1,b=b^1}$$

Reference: 李弘毅 ML Lecture 1 https://youtu.be/CXgbekl0oJc

Machine learning model (2) – Deep learning

Define a function to be learned: $y^n = f(x^n)$



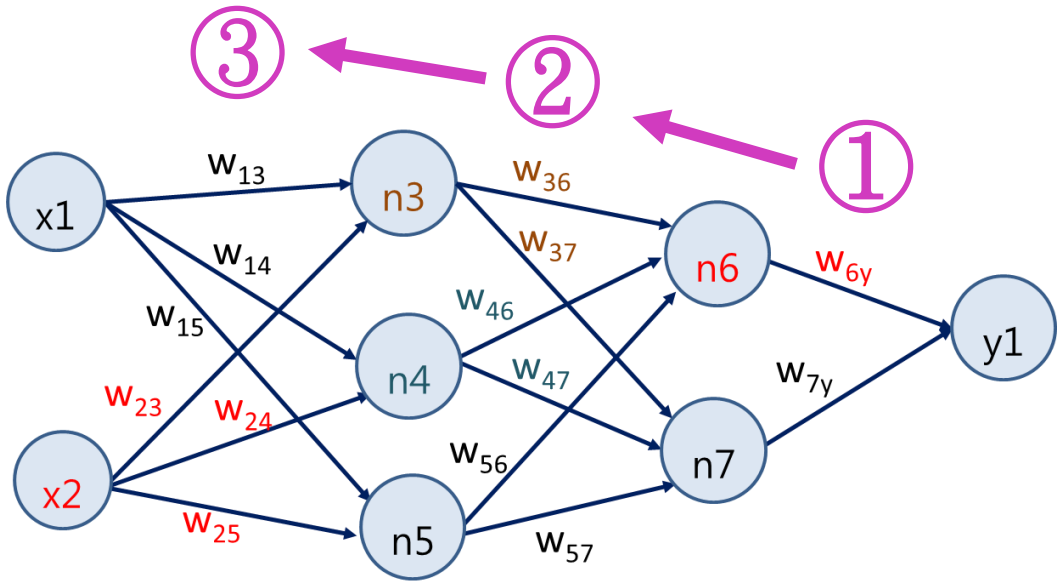
① $n_3 = \sigma(x_1 * w_{13} + x_2 * w_{23} + b_3)$
① $n_4 = \sigma(x_1 * w_{14} + x_2 * w_{24} + b_4)$
① $n_5 = \sigma(x_1 * w_{15} + x_2 * w_{25} + b_5)$

② $n_6 = \sigma(n_3 * w_{36} + n_4 * w_{46} + n_5 * w_{56} + b_6)$
② $n_7 = \sigma(n_3 * w_{37} + n_4 * w_{47} + n_5 * w_{57} + b_7)$

③ $y_1 = \sigma(n_6 * w_{6y} + n_7 * w_{7y} + b_y)$

Machine learning model (2) – Deep learning

Use gradient decent to find optimal parameters



$$L = g(y - \hat{y}) \quad y = \sigma(n_6 * w_{6y} + n_7 * w_{7y} + b_y)$$

① $$w_{6y} \leftarrow w_{6y} - \eta \frac{\partial L}{\partial w_{6y}} \qquad \frac{\partial L}{\partial w_{6y}} = \frac{\partial L}{\partial y}\frac{\partial y}{\partial w_{6y}}$$

① $$w_{7y} \leftarrow w_{7y} - \eta \frac{\partial L}{\partial w_{7y}} \qquad \frac{\partial L}{\partial w_{7y}} = \frac{\partial L}{\partial y}\frac{\partial y}{\partial w_{7y}}$$

$$w_i \leftarrow w_i - \eta \frac{\partial e}{\partial w_i}$$

② $$w_{57} \leftarrow w_{57} - \eta \frac{\partial L}{\partial w_{57}} \qquad \frac{\partial L}{\partial w_{57}} = \frac{\partial L}{\partial y}\frac{\partial y}{\partial n_7}\frac{\partial n_7}{\partial w_{57}}$$

$$n_7 = f(n_3 * w_{37} + n_4 * w_{47} + n_5 * w_{57} + b_7)$$

Jeffery Hinton

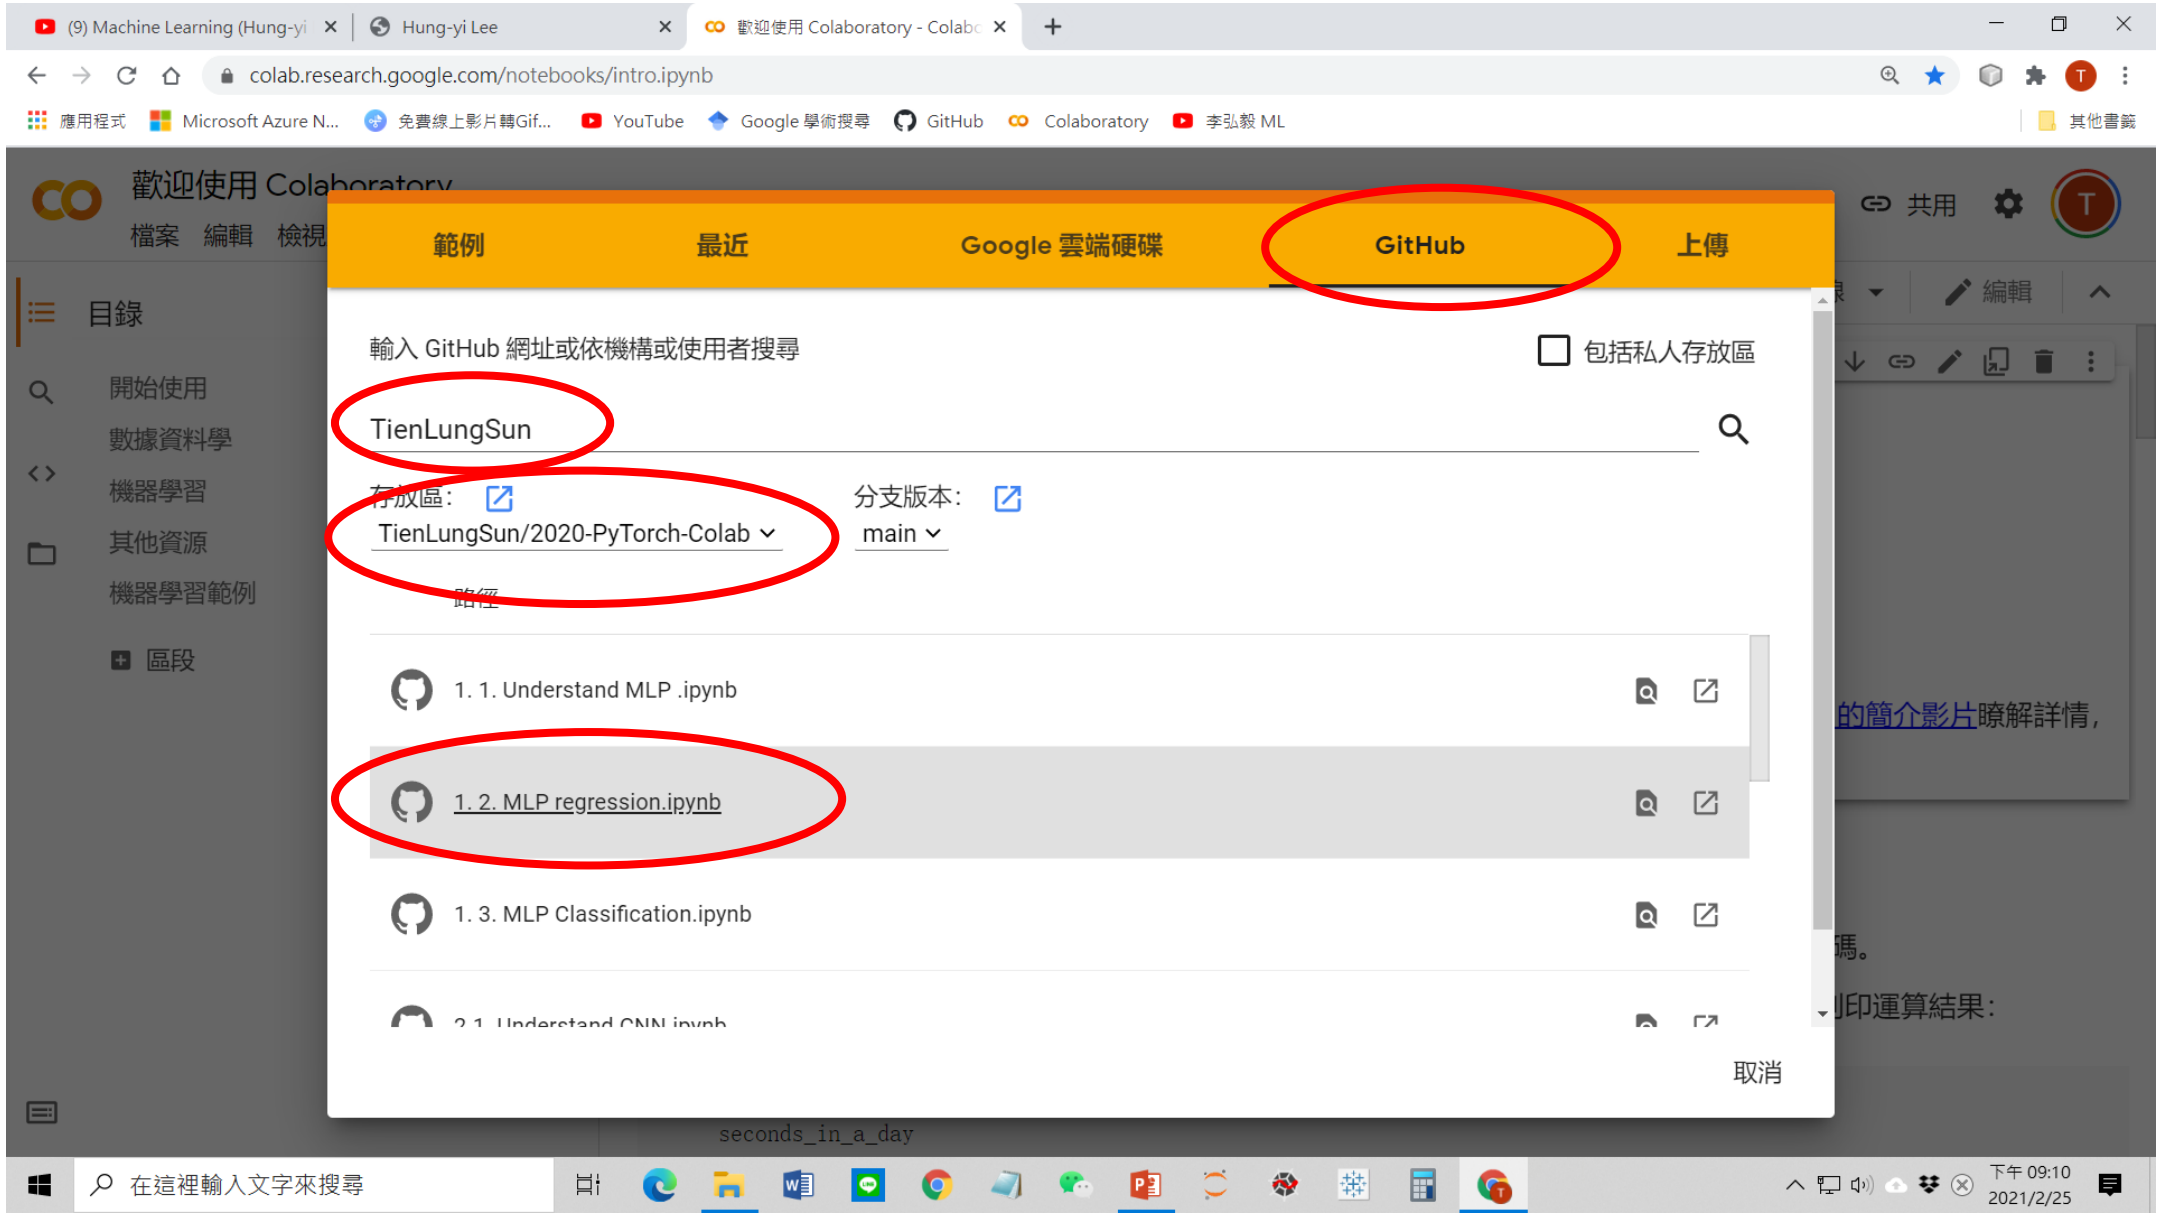
Geoffrey Hinton spent 30 years hammering away at an idea most other scientists dismissed as nonsense. Then, one day in 2012, he was proven right. Canada's most influential thinker in the field of artificial intelligence is far too classy to say I told you so

https://torontolife.com/tech/ai-superstars-google-facebook-apple-studied-guy/

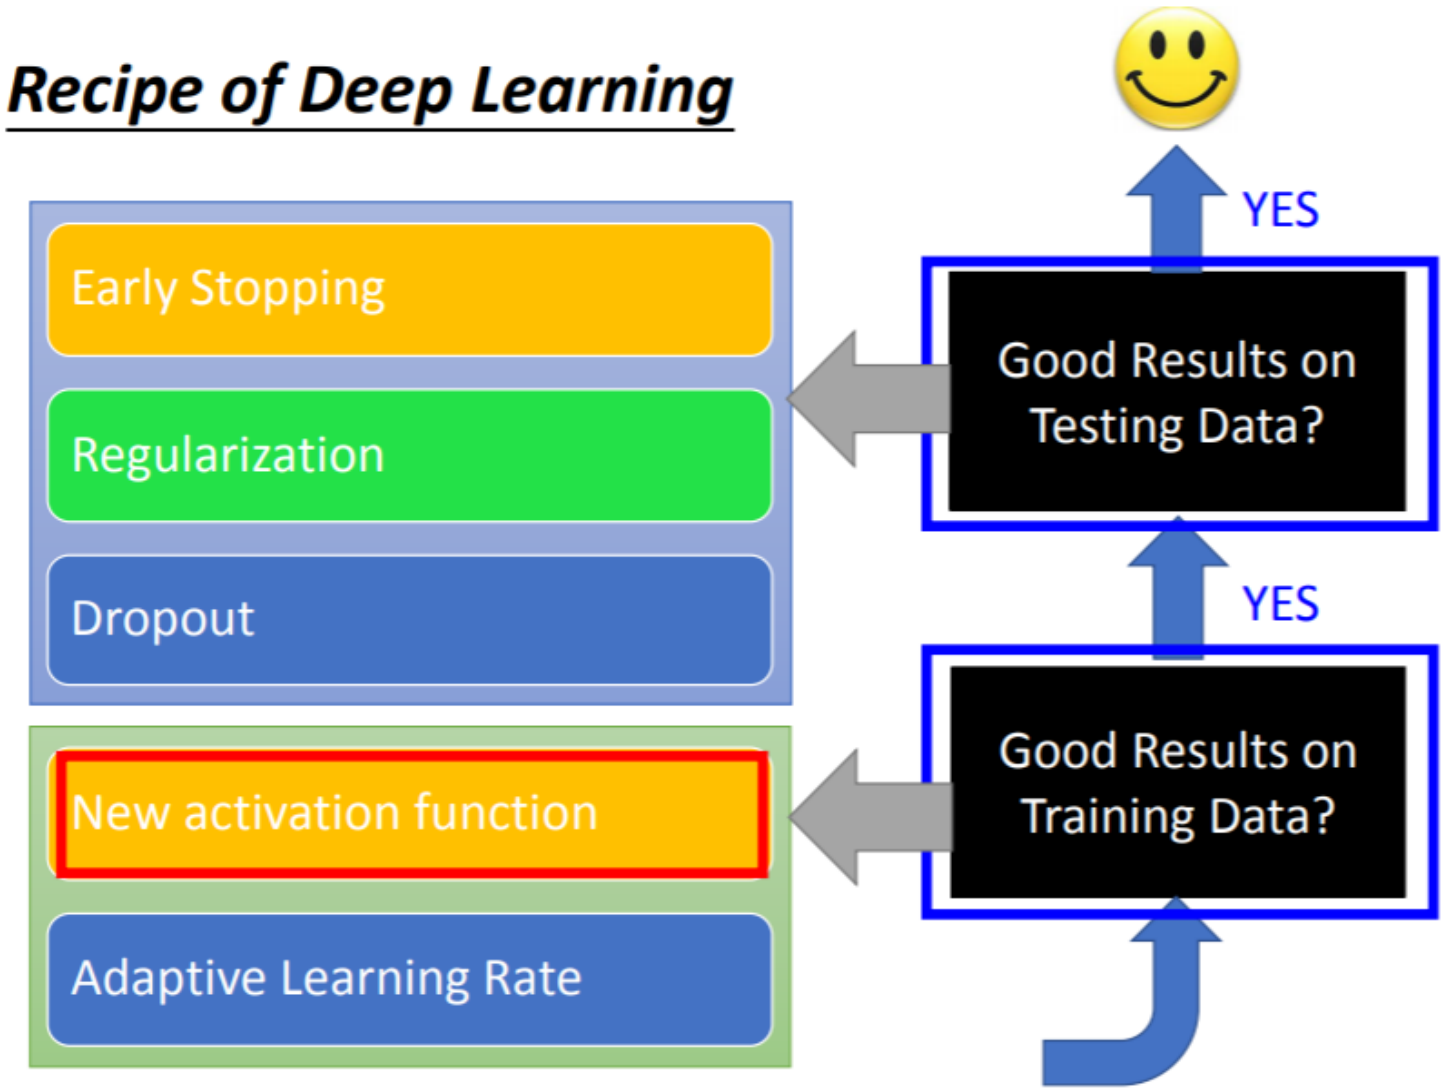
For more than 30 years, Geoffrey Hinton hovered at the edges of artificial intelligence research, an outsider clinging to a simple proposition: that computers could think like humans do—using intuition rather than rules.

Geoffrey Hinton 多年來堅持着一個簡單的觀點：電腦可以像人類一樣思考-用直覺而不是規則。
Hinton 一直好奇的是，電腦能不能像人類大腦一樣的工作：信息通過一個巨大的，由神經元圖譜連接起來的細胞網絡傳播，在多達十億條的路徑上發射、連接和傳輸。

Practice – MLP regression



When training result is not good

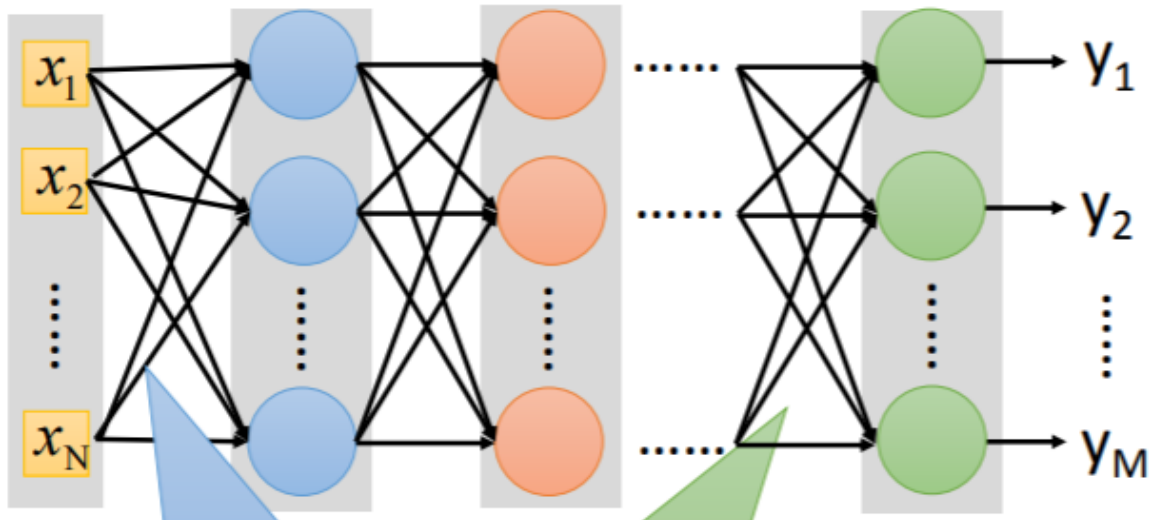


Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Practice – Activation function

- Run "1.2 MLP regression.ipynb", change the activation function from ReLU to Sigmoid and explain why the results become worse?

Vanishing gradient problem



Smaller gradients

Learn very slow

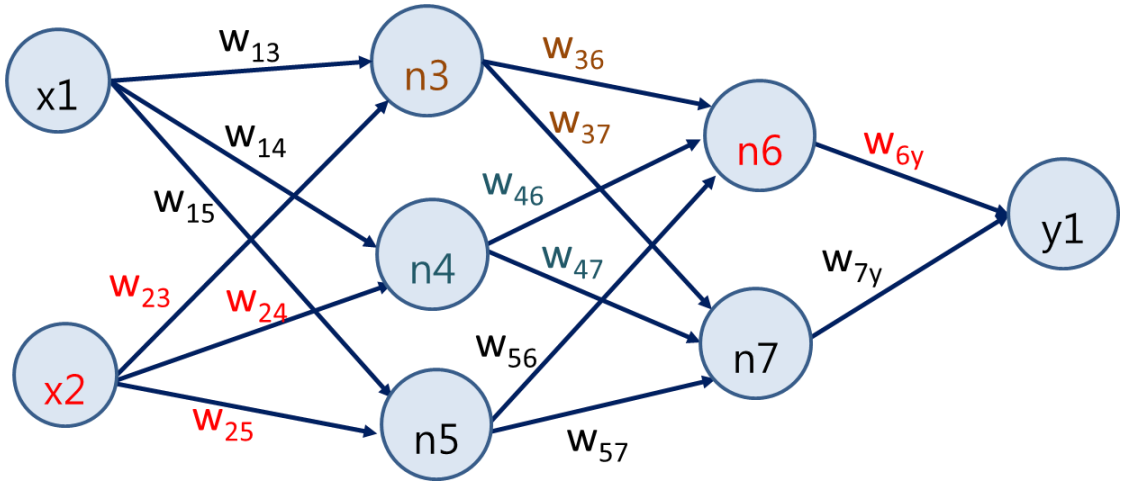
Almost random

Larger gradients

Learn very fast

Already converge

based on random!?



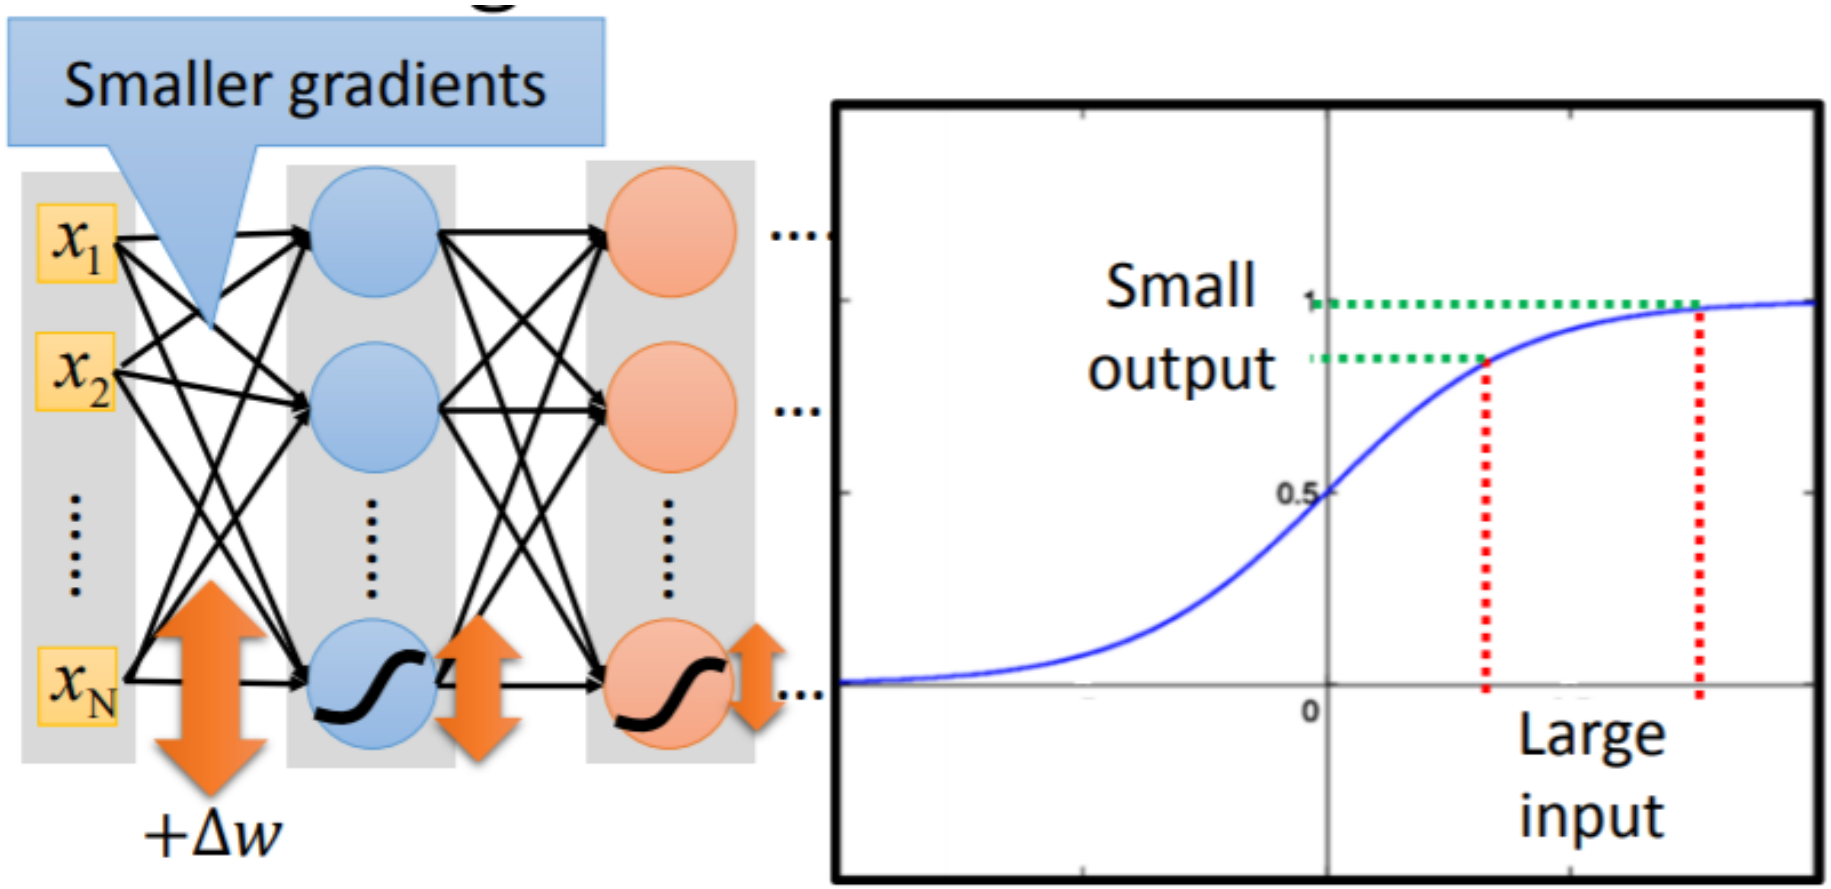
$$\frac{\partial L}{\partial w_{6y}} = \frac{\partial L}{\partial y_1}\frac{\partial y_1}{\partial w_{6y}}$$

$$\frac{\partial L}{\partial w_{57}} = \frac{\partial L}{\partial y_1}\frac{\partial y_1}{\partial n_7}\frac{\partial n_7}{\partial w_{57}}$$

Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

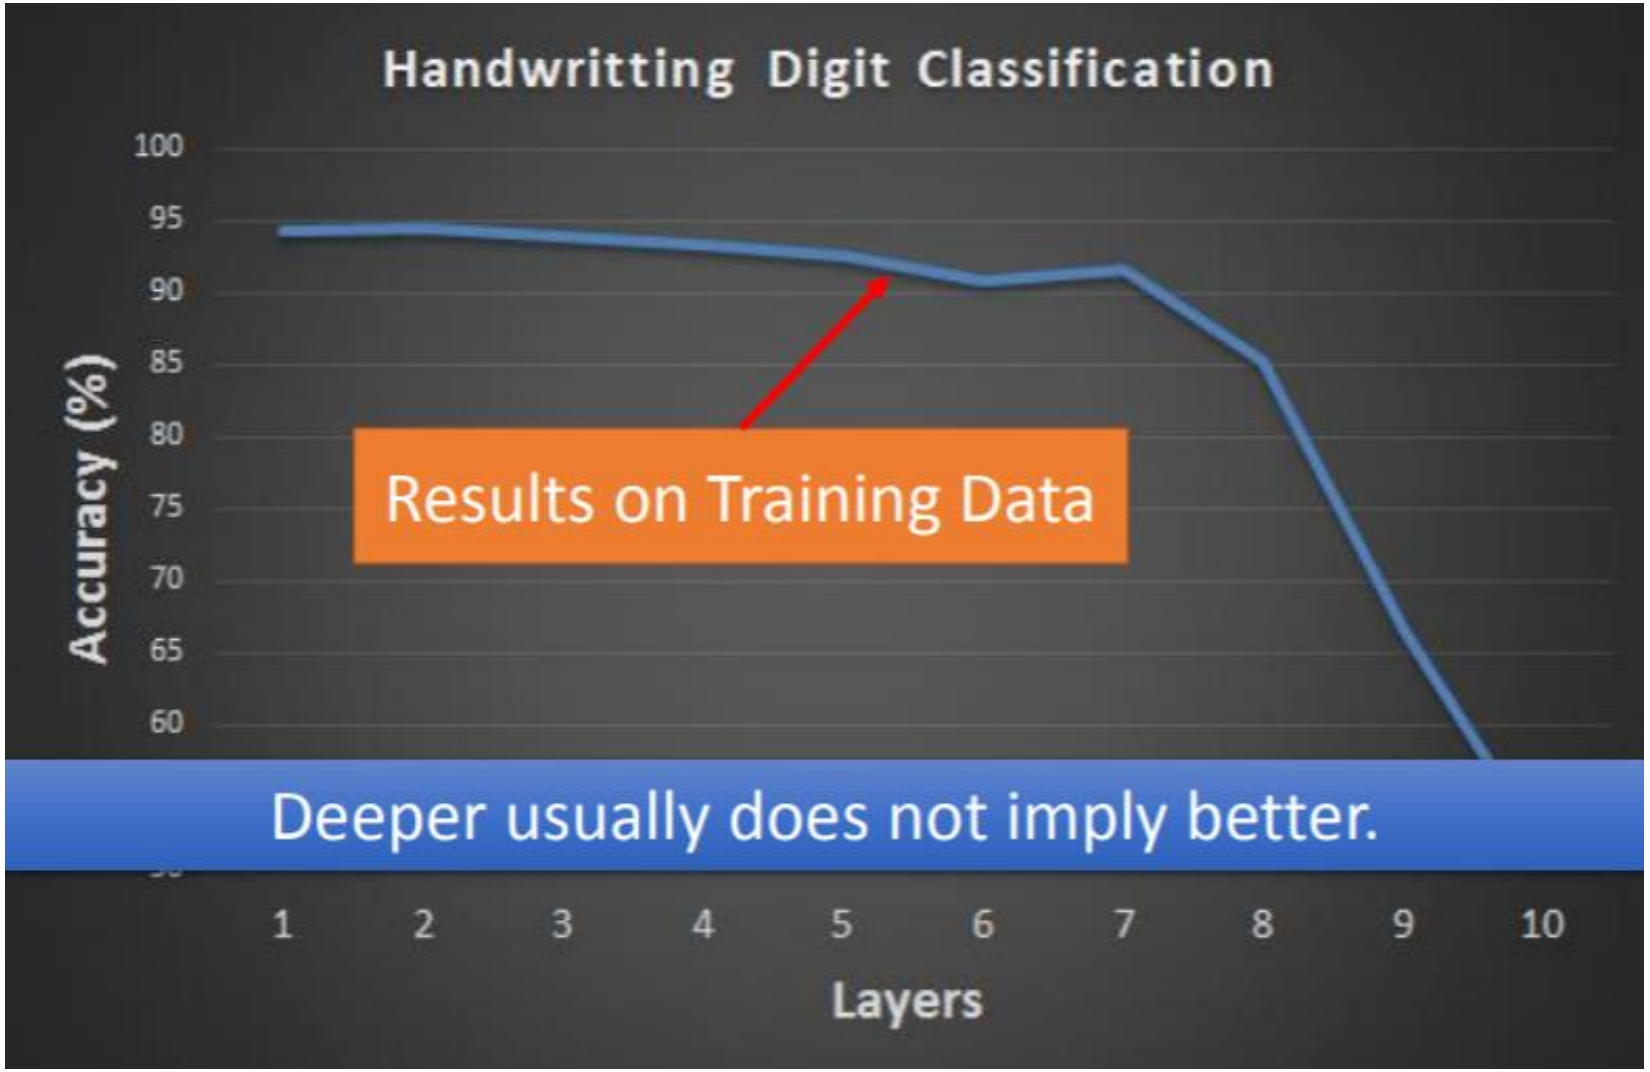
Vanishing gradient problem

$n_7 = \sigma(n_3 * w_{37} + n_4 * w_{47} + n_5 * w_{57} + b_7)$



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

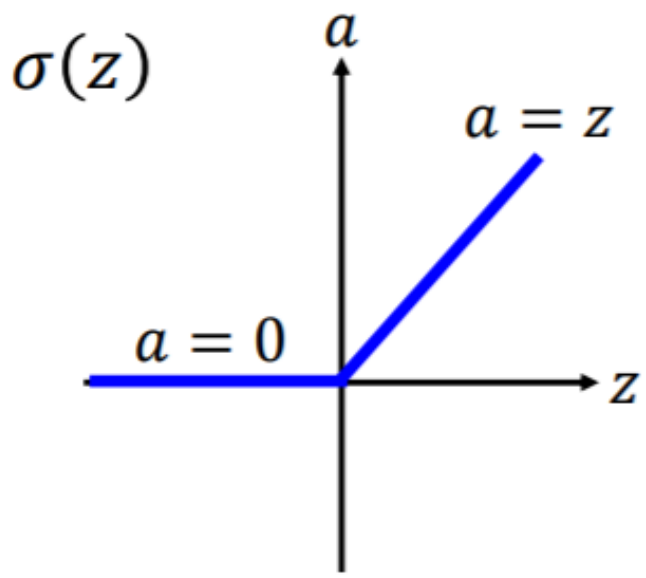
Sigmoid is hard to get the power of deep



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

ReLU

- Rectified Linear Unit (ReLU)



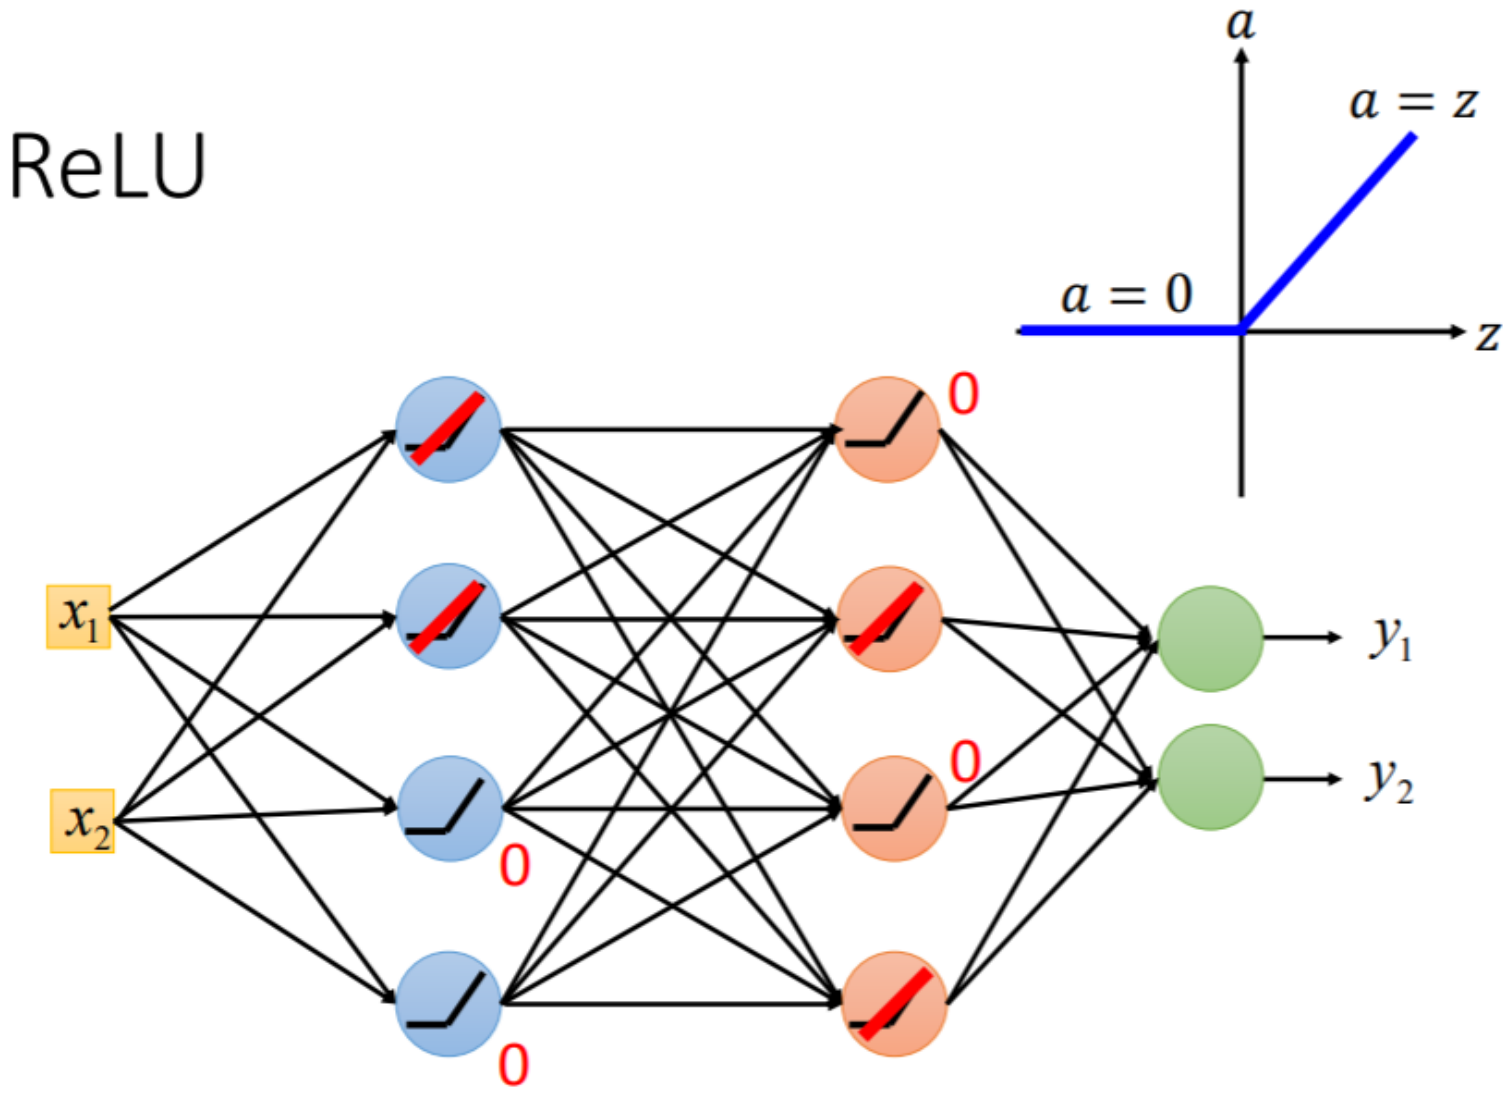
[Xavier Glorot, AISTATS'11]
[Andrew L. Maas, ICML'13]
[Kaiming He, arXiv'15]

Reason:

1. Fast to compute
2. Biological reason
3. Infinite sigmoid with different biases
4. Vanishing gradient problem

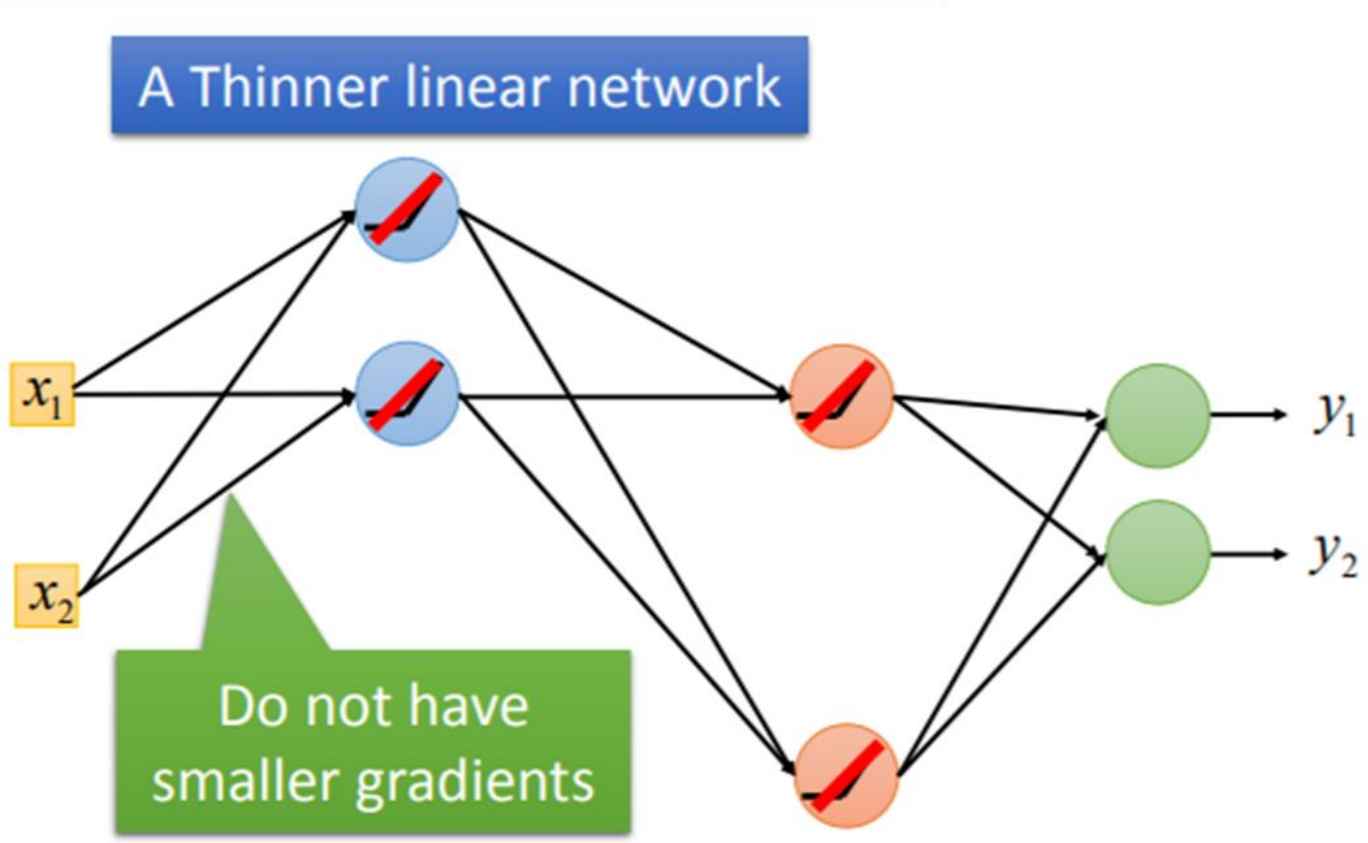
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

ReLU



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

ReLU



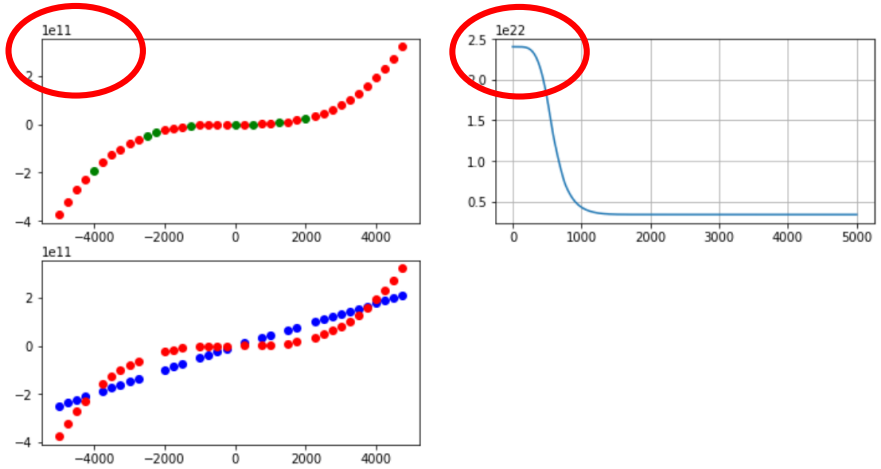
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Practice

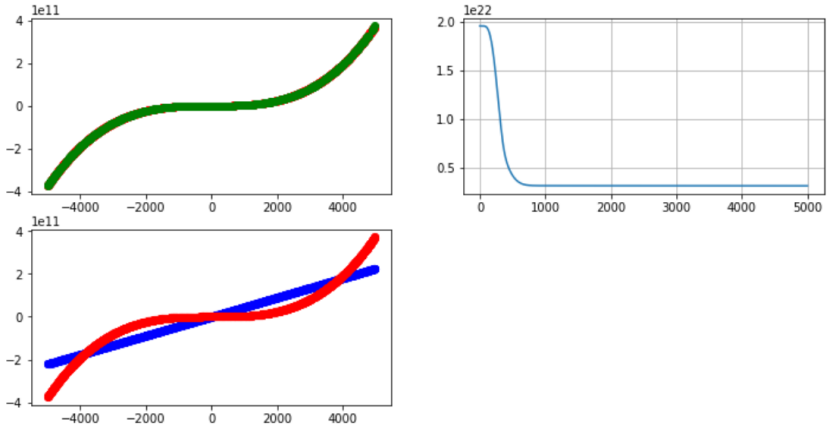
- Run "1. 2.1 MLP regression practice.ipynb"

3-Lyaer NN

Without normalization, the 3-layer NN is not able to learn from 32 data sampled from -5000 to 5000.

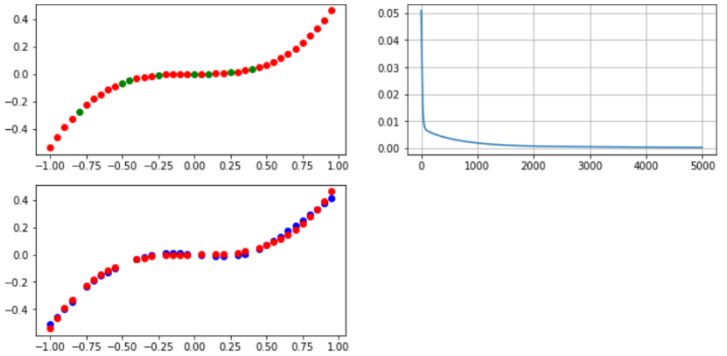


Increase the number of data from 32 to 1600. Without normalization, the 3-layer NN is not able to learn.

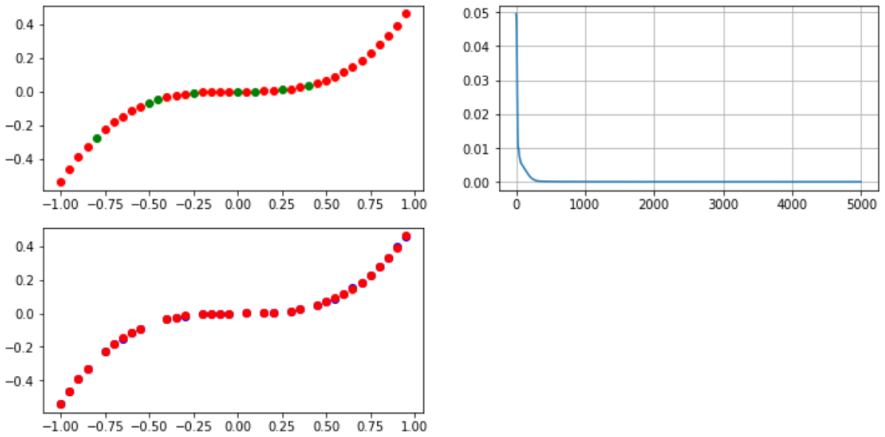


2-Lyaer NN

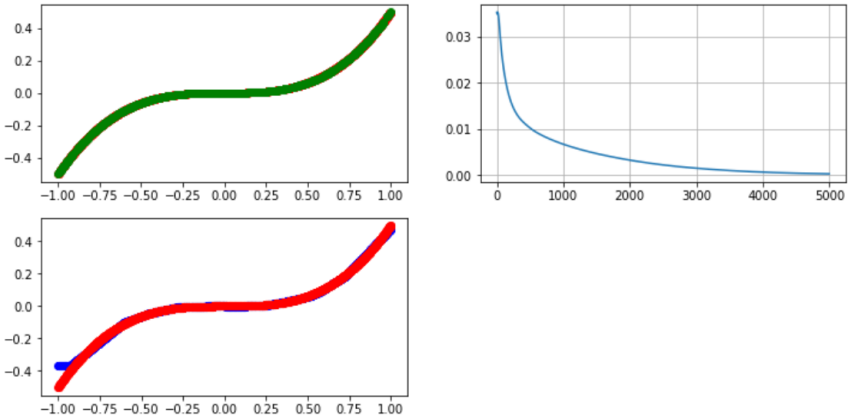
The 2-layer NN can also learn from 32 data. As long as x and y are normalized and the data full describe the characteristics of the cubic function.



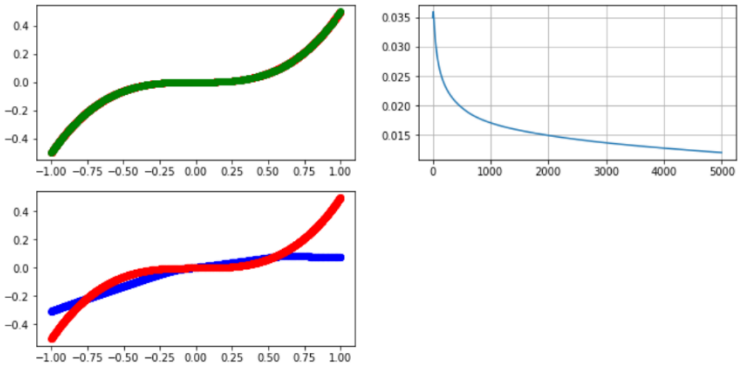
With both x and y normalized to [-1, 1], the 3-layer NN is able to learn from 32 data sampled from [-5000, 5000] that full describe the characteristics of the cubic function.



With both x and y normalized to [-1, 1], the 3-layer NN is able to learn from 1600 data. But the results are not as good as the 32 data case.



Even x and y are normalized to [-1, 1], the 2-layer NN is not able to learn from 1600 data.

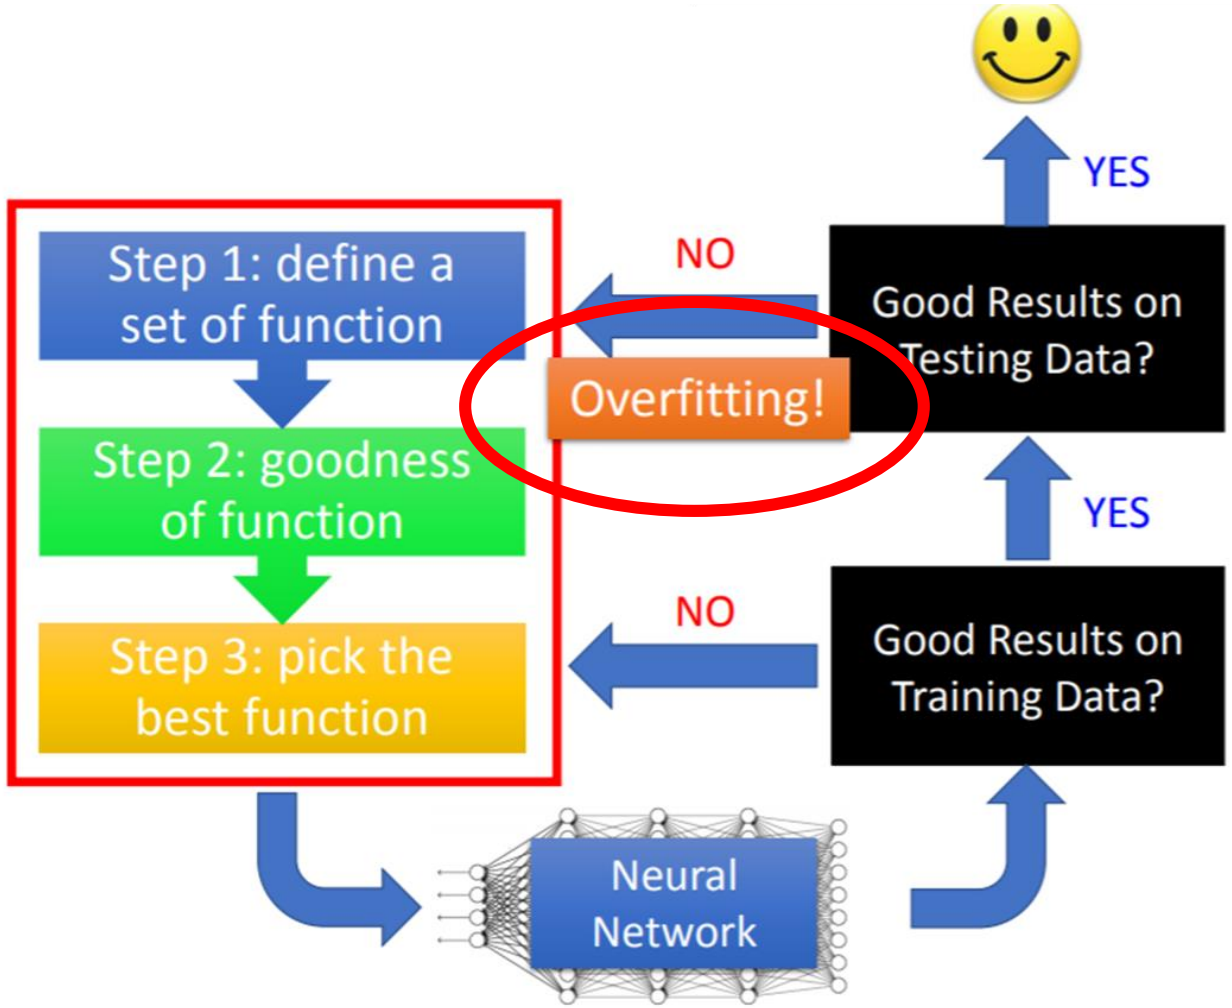


HW3 (1)

- Design your training data and $y = f(x)$. Experiment with different NN designs.

		Training
No of parameters =	Deep and thing	
	Shallow and fat	
	In-between version	
No of parameters =	Deep and thing	
	Shallow and fat	
	In-between version	

Overfitting - *NN* performs well on training data but not good on test data



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Overfitting problem

	Training	Testing
1	31.9	35.0
2	15.4	18.4
3	15.3	18.1
4	14.9	28.2
5	12.8	232.1

A more complex model does not always lead to better performance on ***testing data***.

This is ***Overfitting***. → Select suitable model

Reference: 李弘毅 ML Lecture 1 https://youtu.be/CXgbekl66jc

	Underfitting	Just right	Overfitting
Symptoms	• High training error • Training error close to test error • High bias	• Training error slightly lower than test error	• Very low training error • Training error much lower than test error • High variance
Regression illustration			
Classification illustration			Deep learning illustration			Possible remedies	• Complexify model • Add more features • Train longer		• Perform regularization • Get more data

https://www.facebook.com/buggyprogrammers/photos/a.113230983855158/213140590530863/

Practice – Overfitting

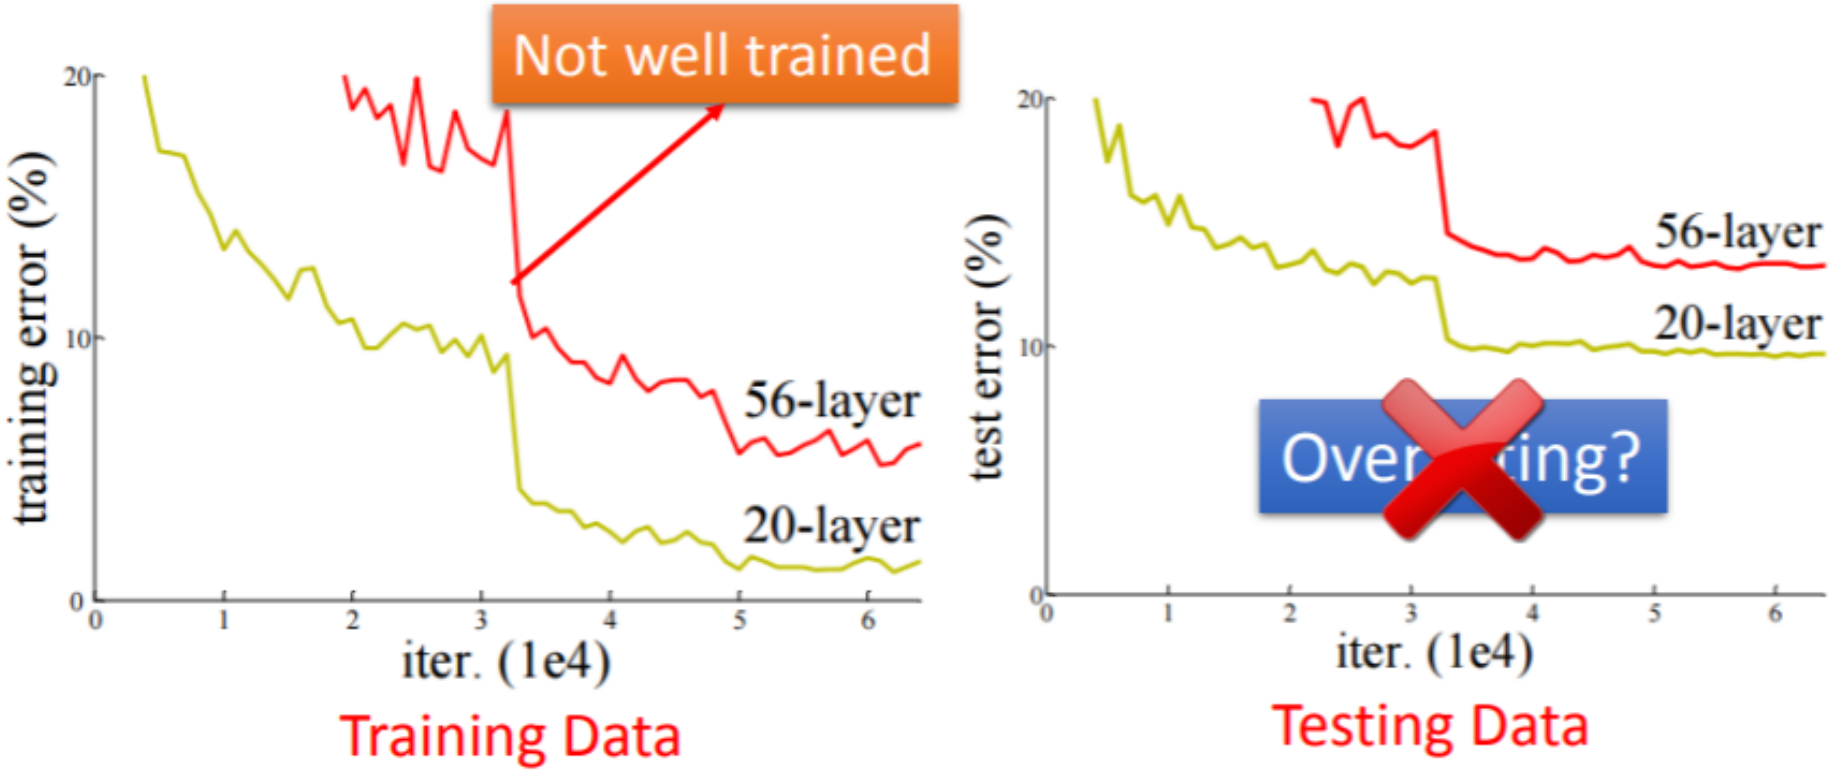
- Run "1. 2.2. Overfitting.ipynb", observe the overfitting problem.

HW3 (2)

- Extend HW3(1) to report overfitting problem.

		Training	Testing
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		

Do not always blame overfitting



Deep Residual Learning for Image Recognition
http://arxiv.org/abs/1512.03385

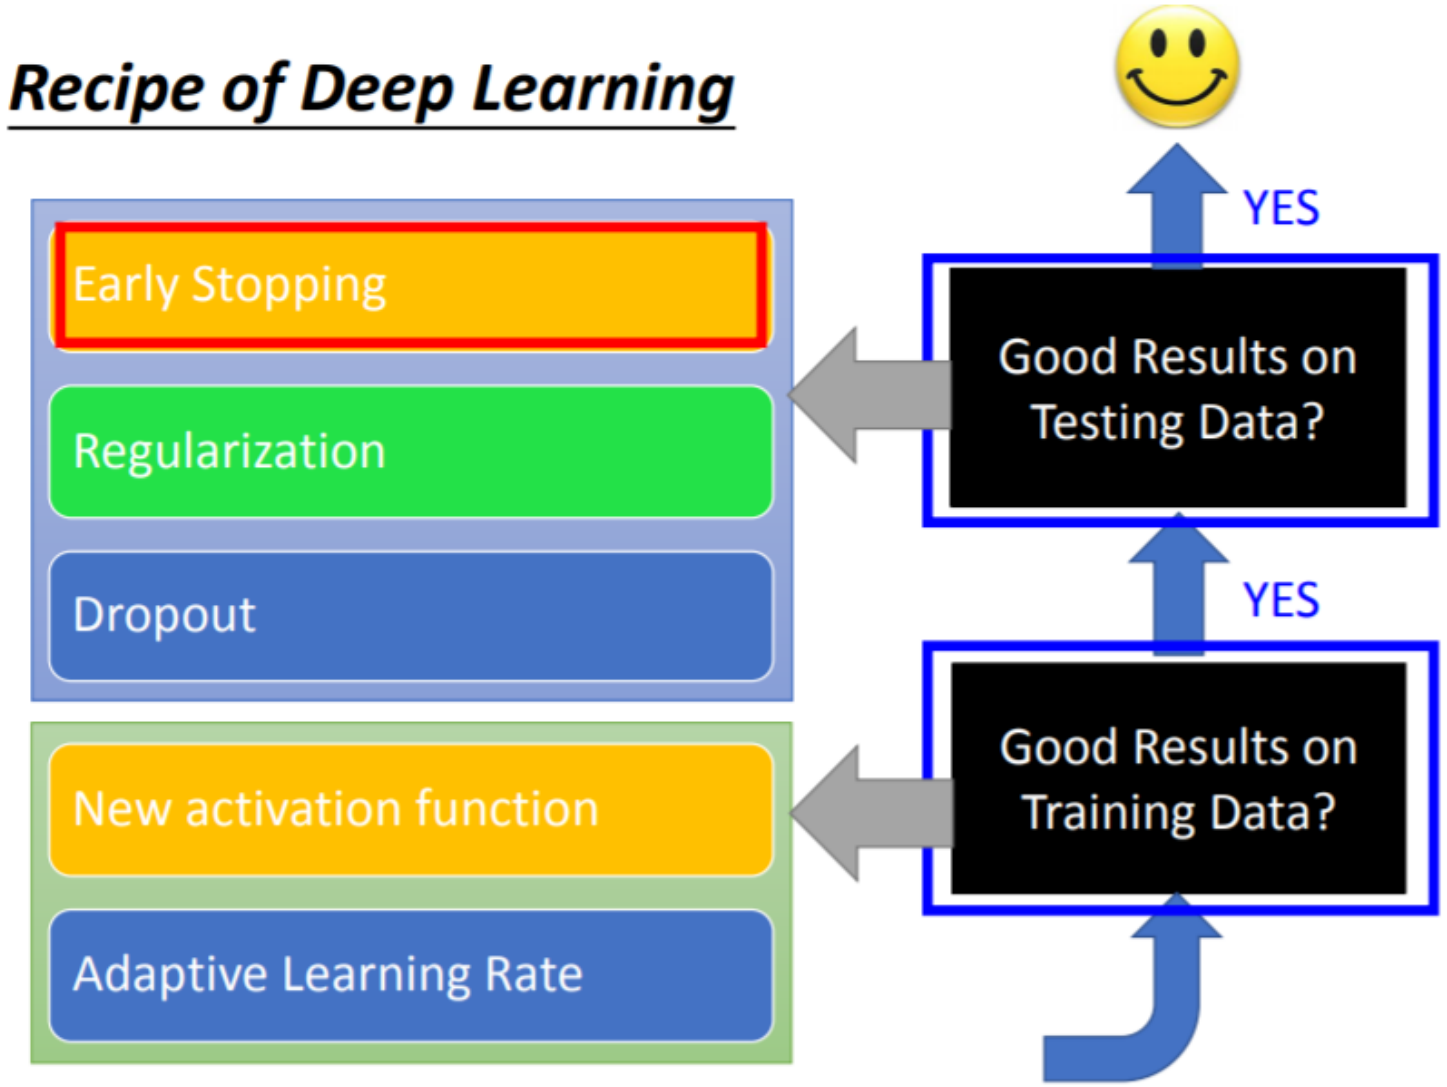
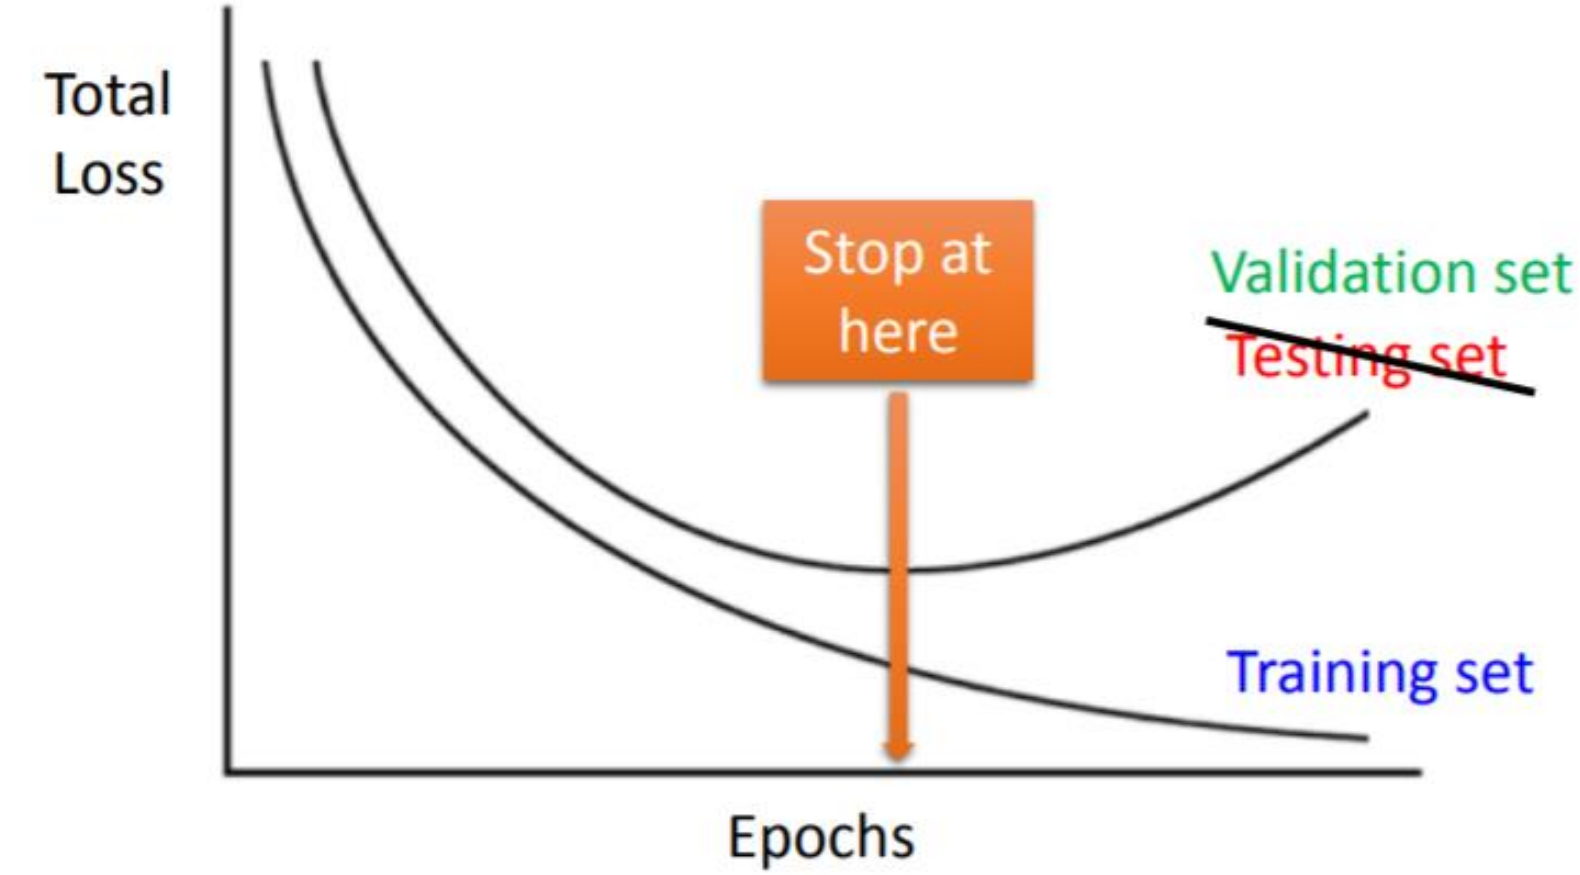
What to do if overfitting?



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Early stopping



Keras: http://keras.io/getting-started/faq/#how-can-i-interrupt-training-when-the-validation-loss-isnt-decreasing-anymore

Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

HW3 (3)

- Based on HW3(2), experiment the effect of early stop on resolving overfitting.

		Training with early stop	Testing
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		

Regularization – L2

- Find a set of weight not only minimizing original cost but also close to zero

$$L'(\theta) = L(\theta) + \lambda \frac{1}{2} \|\theta\|_2$$

→ Regularization term

Original loss

$$L(\theta) = \sum_{n=1}^{N} (\hat{y}^n - y^n)^2$$

$$\theta = \{w_1, w_2, \ldots\}$$

L2 regularization:

$$\|\theta\|_2 = (w_1)^2 + (w_2)^2 + \ldots$$

(usually not consider biases)

Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

L2 regularization

$$L'(\theta) = L(\theta) + \lambda \frac{1}{2}\|\theta\|_2 \quad \text{Gradient:} \quad \frac{\partial L'}{\partial w} = \frac{\partial L}{\partial w} + \lambda w$$

Update:

$$w^{t+1} \rightarrow w^t - \eta \frac{\partial L'}{\partial w} = w^t - \eta\left(\frac{\partial L}{\partial w} + \lambda w^t\right)$$

$$= (1 - \eta\lambda) w^t - \eta \frac{\partial L}{\partial w}$$

Weight Decay

$(1 - \eta\lambda) w^t$: Closer to zero

Vanilla gradient decent update $w^{t+1} \rightarrow w^t - \eta \frac{\partial L}{\partial w}$

Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

HW3 (4)

- Based on HW3(2), experiment the effect of L2 regularization on resolving overfitting.

		Train with L2 regularization	Testing
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		

L1 regularization

L1 regularization:

$$\|\theta\|_1 = |w_1| + |w_2| + \dots$$

$$L'(\theta) = L(\theta) + \lambda \frac{1}{2}\|\theta\|_1 \qquad \frac{\partial L'}{\partial w} = \frac{\partial L}{\partial w} + \lambda \operatorname{sgn}(w)$$

Update:

$$w^{t+1} \rightarrow w^t - \eta \frac{\partial L'}{\partial w} = w^t - \eta\left(\frac{\partial L}{\partial w} + \lambda \operatorname{sgn}\left(w^t\right)\right)$$

$$= w^t - \eta \frac{\partial L}{\partial w} - \eta\lambda \operatorname{sgn}\left(w^t\right)$$ Always delete

$$= (1 - \eta\lambda) w^t - \eta \frac{\partial L}{\partial w}$$ L2

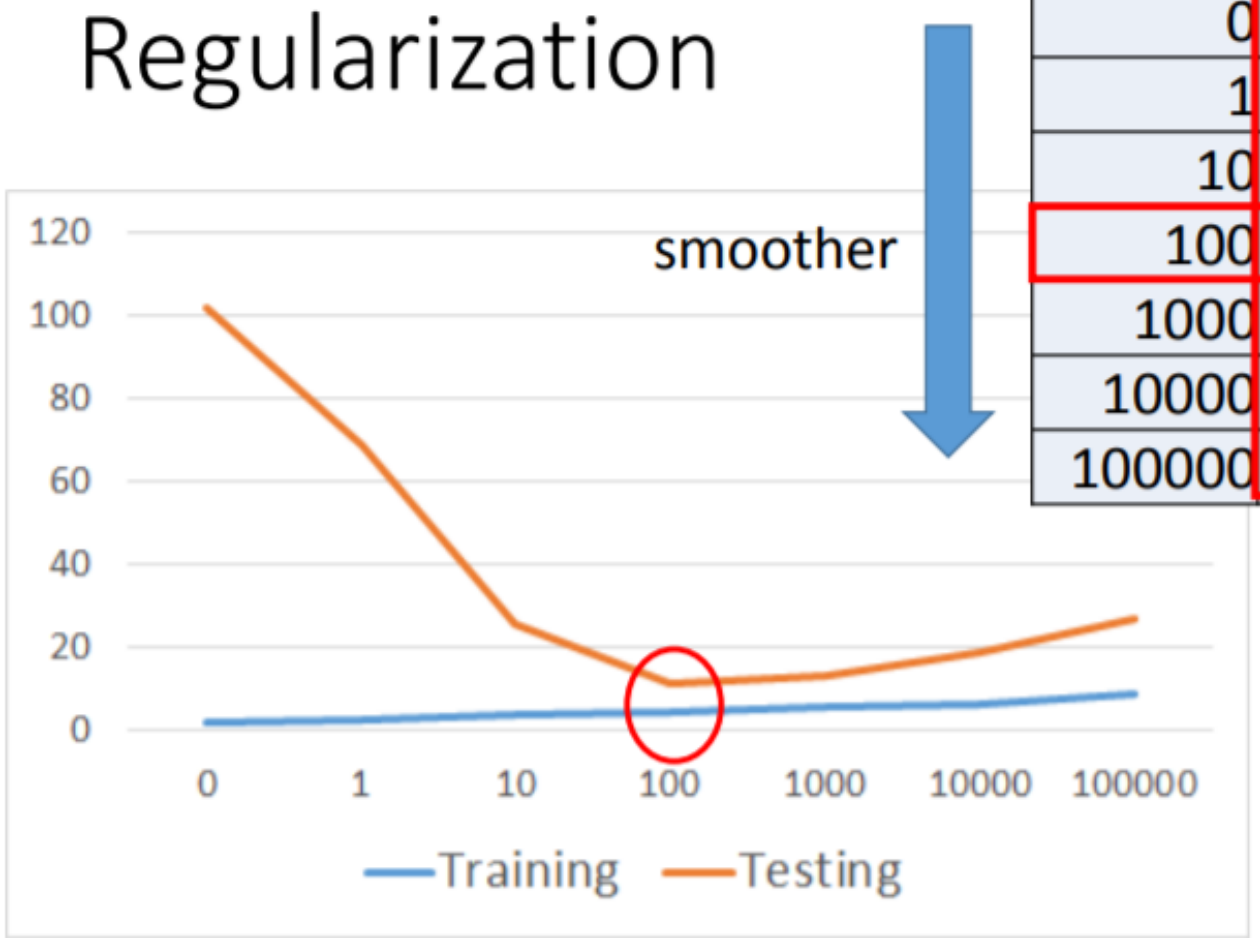
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

HW3 (5)

- Based on HW3(2), experiment the effect of L1 regularization on resolving overfitting.

		Train with L1 regularization	Testing
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		

Regularization



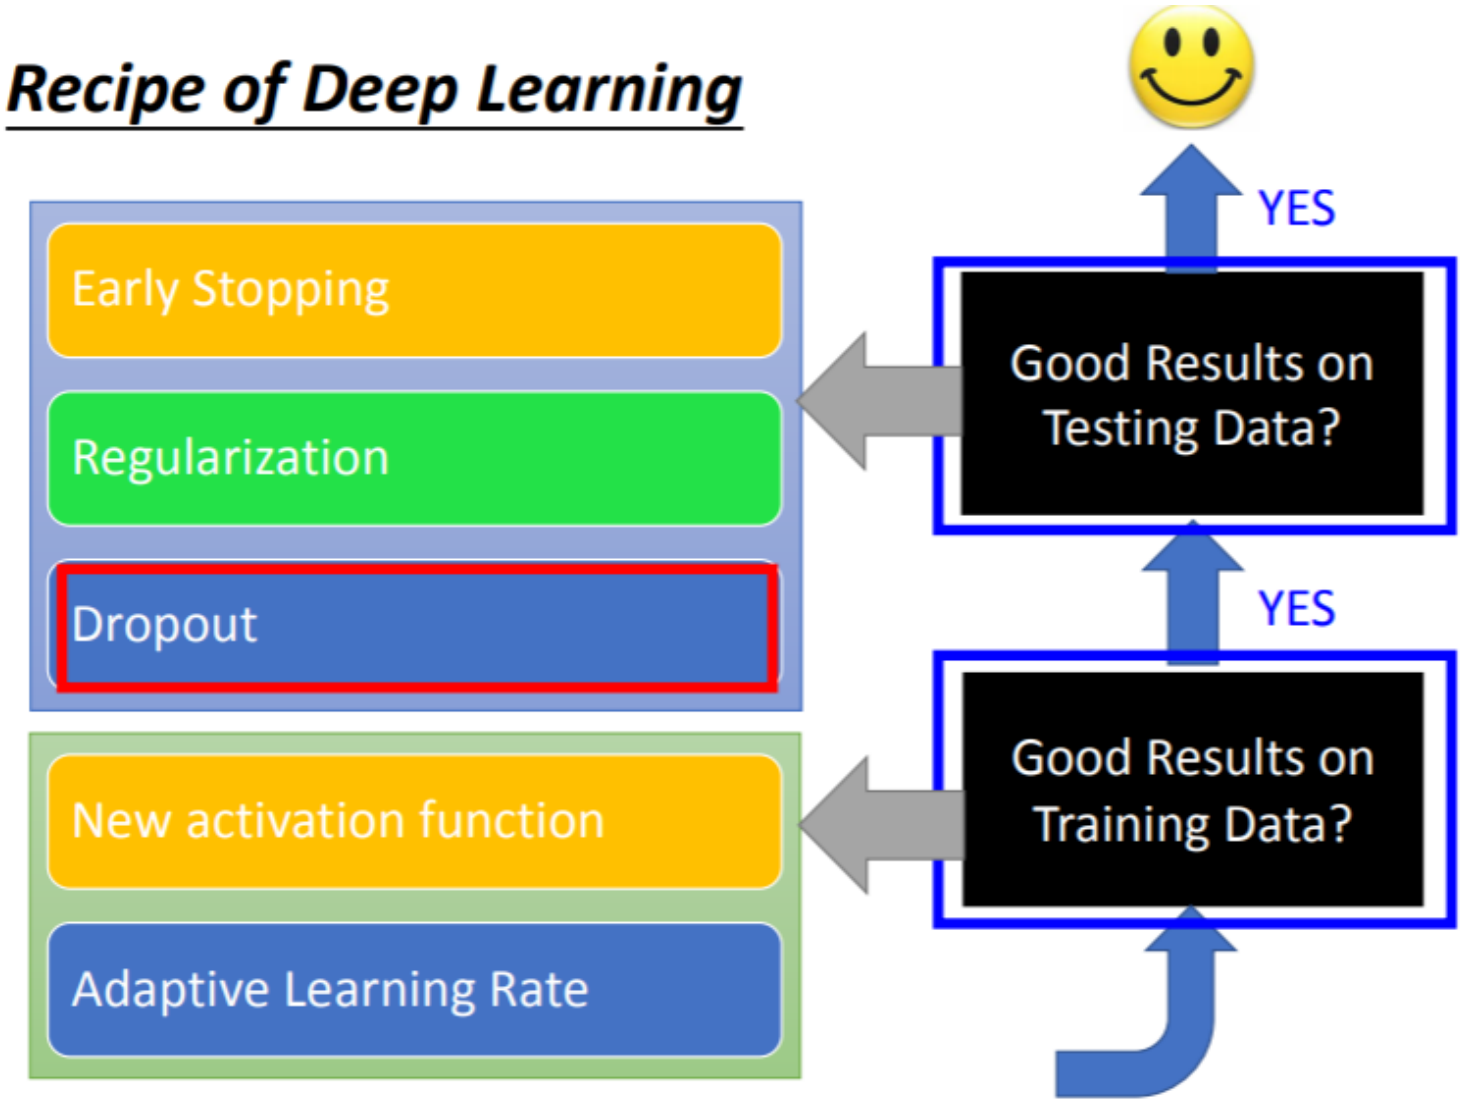
λ	Training	Testing
0	1.9	102.3
1	2.3	68.7
10	3.5	25.7
100	4.1	11.1
1000	5.6	12.8
10000	6.3	18.7
100000	8.5	26.8

How smooth?

Select λ obtaining the best model

Reference: 李弘毅 ML Lecture 1 https://youtu.be/CXgbekl66jc

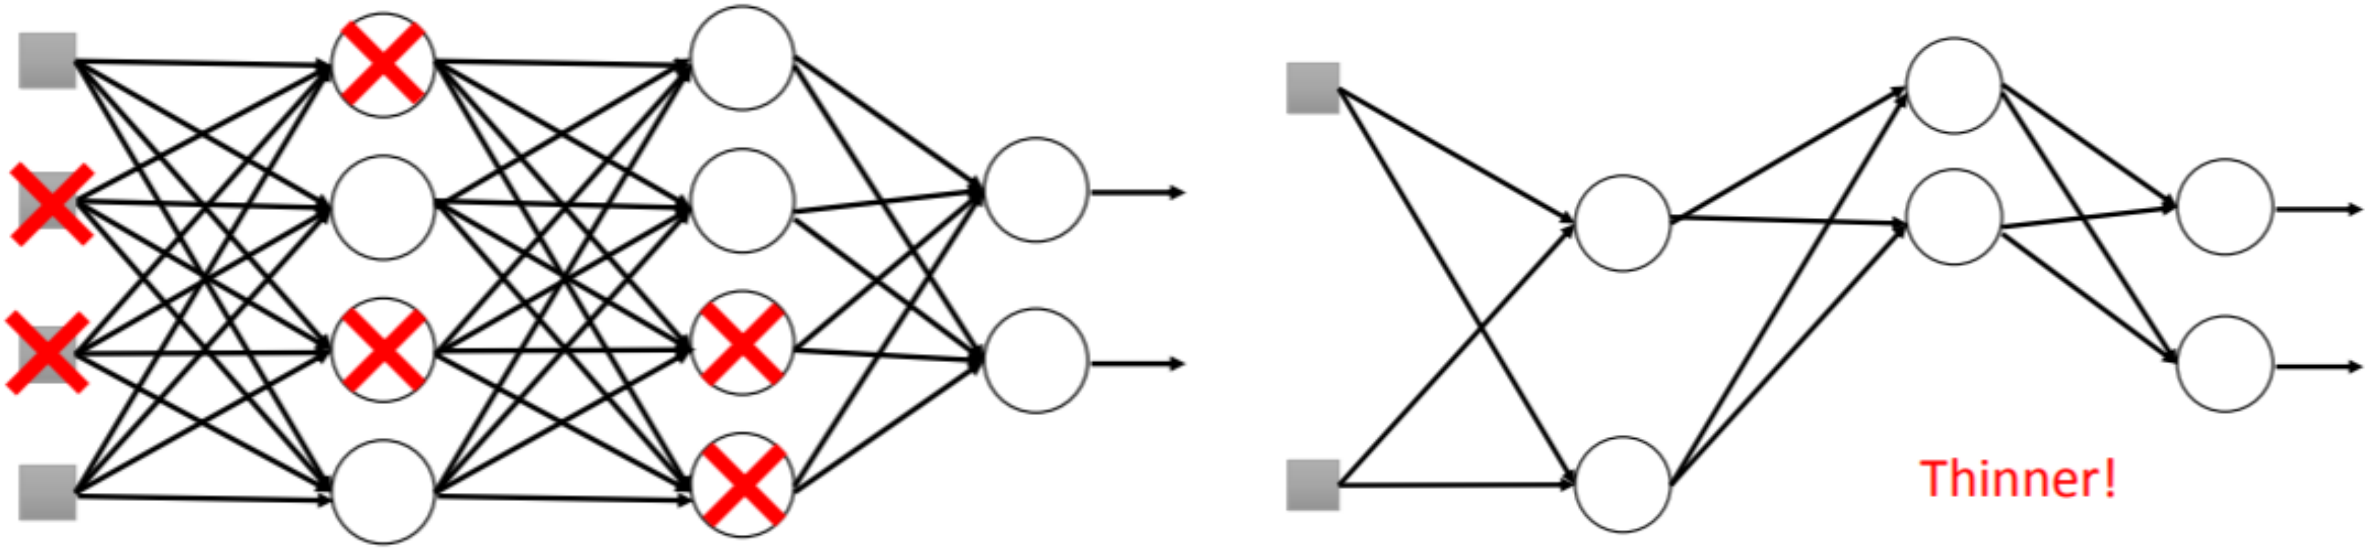
Drop out



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Drop out

Each time before updating θ, each neuron has $p\%$ to dropout. So the *NN* structure is changed (become thinner). That is, for each mini-batch, we resample the dropout neurons.

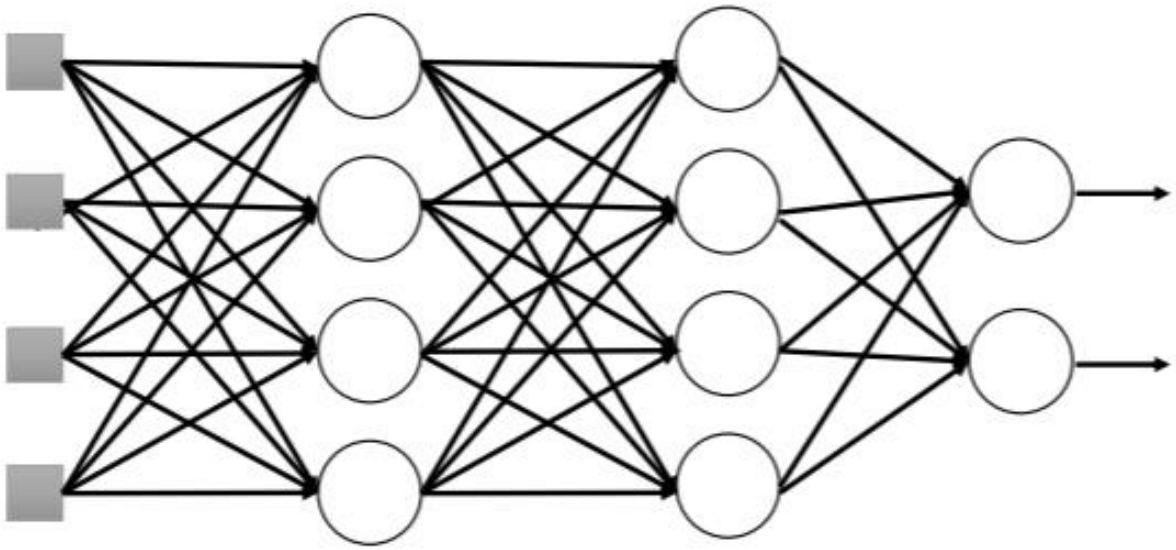


Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Drop out

No neuron drop out at test stage. All weights time $1 - p\%$

Testing:



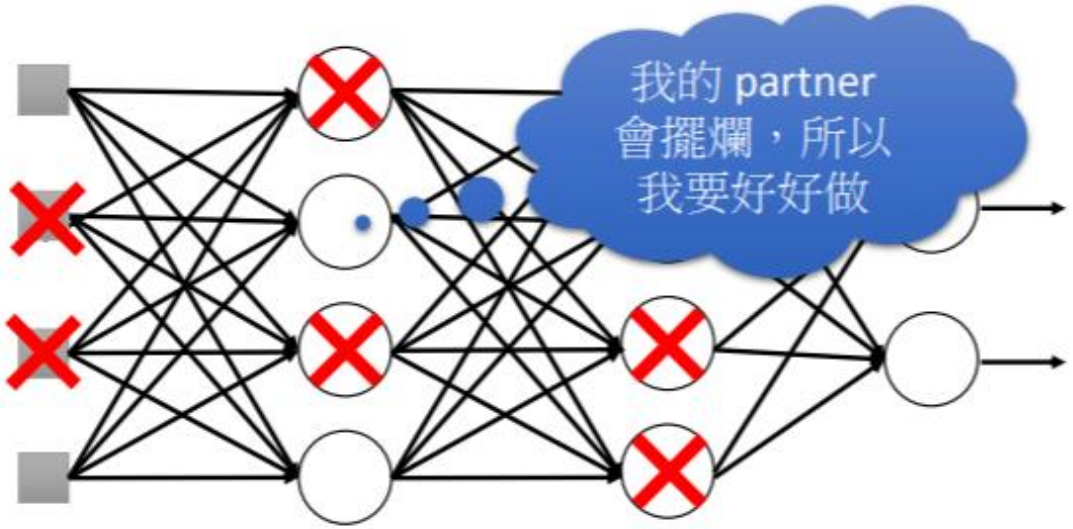
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

HW3 (6)

- Based on HW3(2), experiment the effect of drop out on resolving overfitting.

		Train using drop out	Testing
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		
No of parameters =	Deep and thing		
	Shallow and fat		
	In-between version		

Why drop out makes NN perform better?



- When teams up, if everyone expect the partner will do the work, nothing will be done finally.
- However, if you know your partner will dropout, you will do better.
- When testing, no one dropout actually, so obtaining good results eventually.

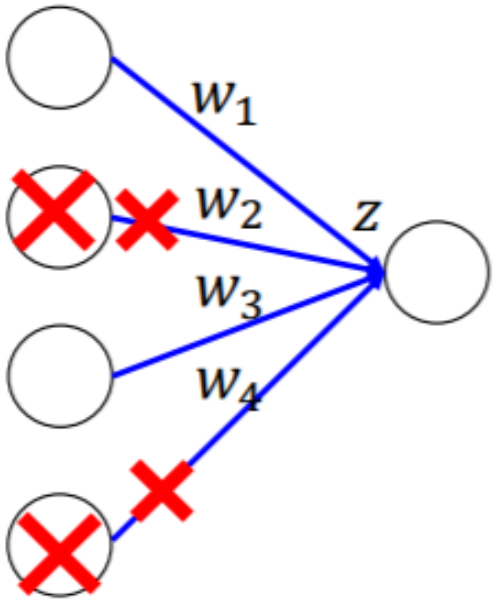
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Why multiply weights by (1-p)% during testing?

- Why the weights should multiply (1-p)% (dropout rate) when testing?

Training of Dropout

Assume dropout rate is 50%

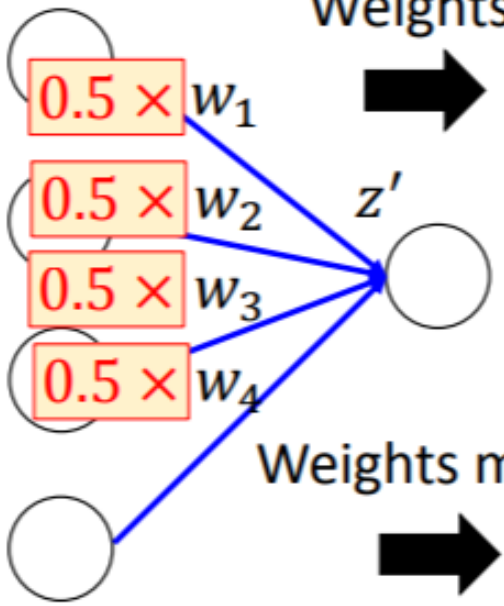


Testing of Dropout

No dropout

Weights from training

$z' \approx 2z$



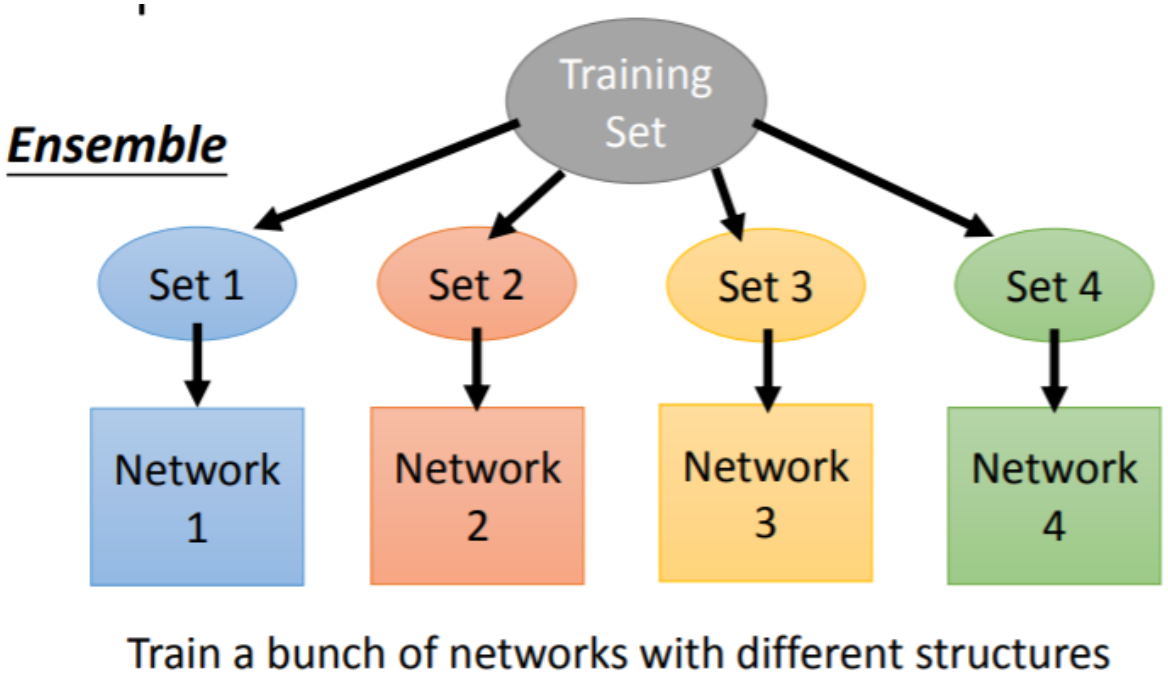
Weights multiply 1-p%

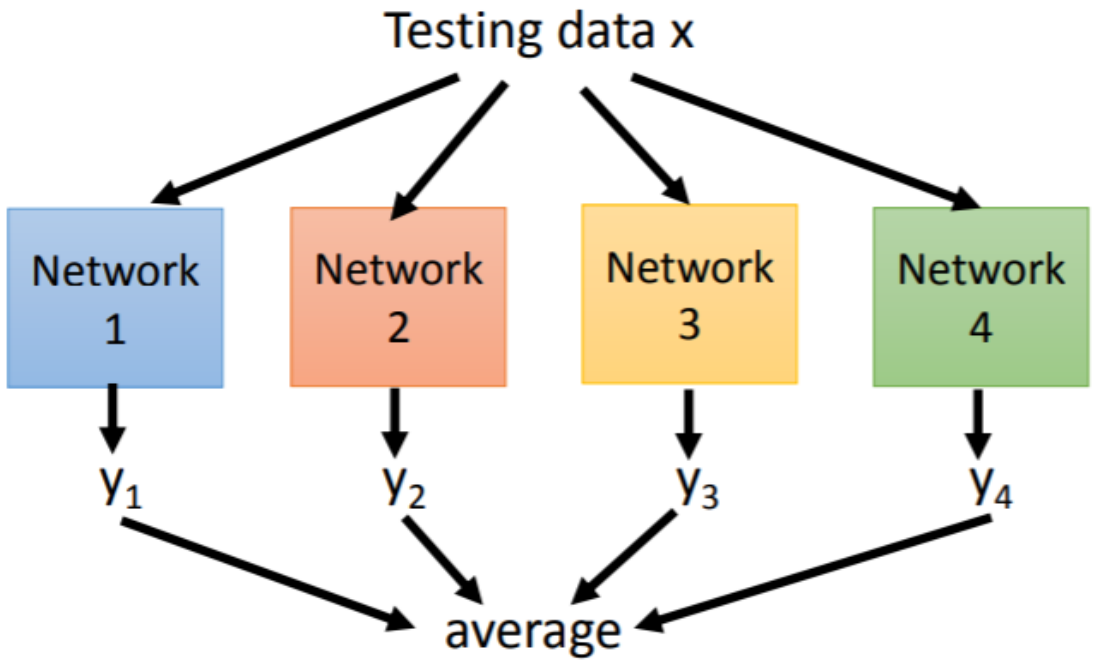
$z' \approx z$

Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Why drop out makes NN performs better?

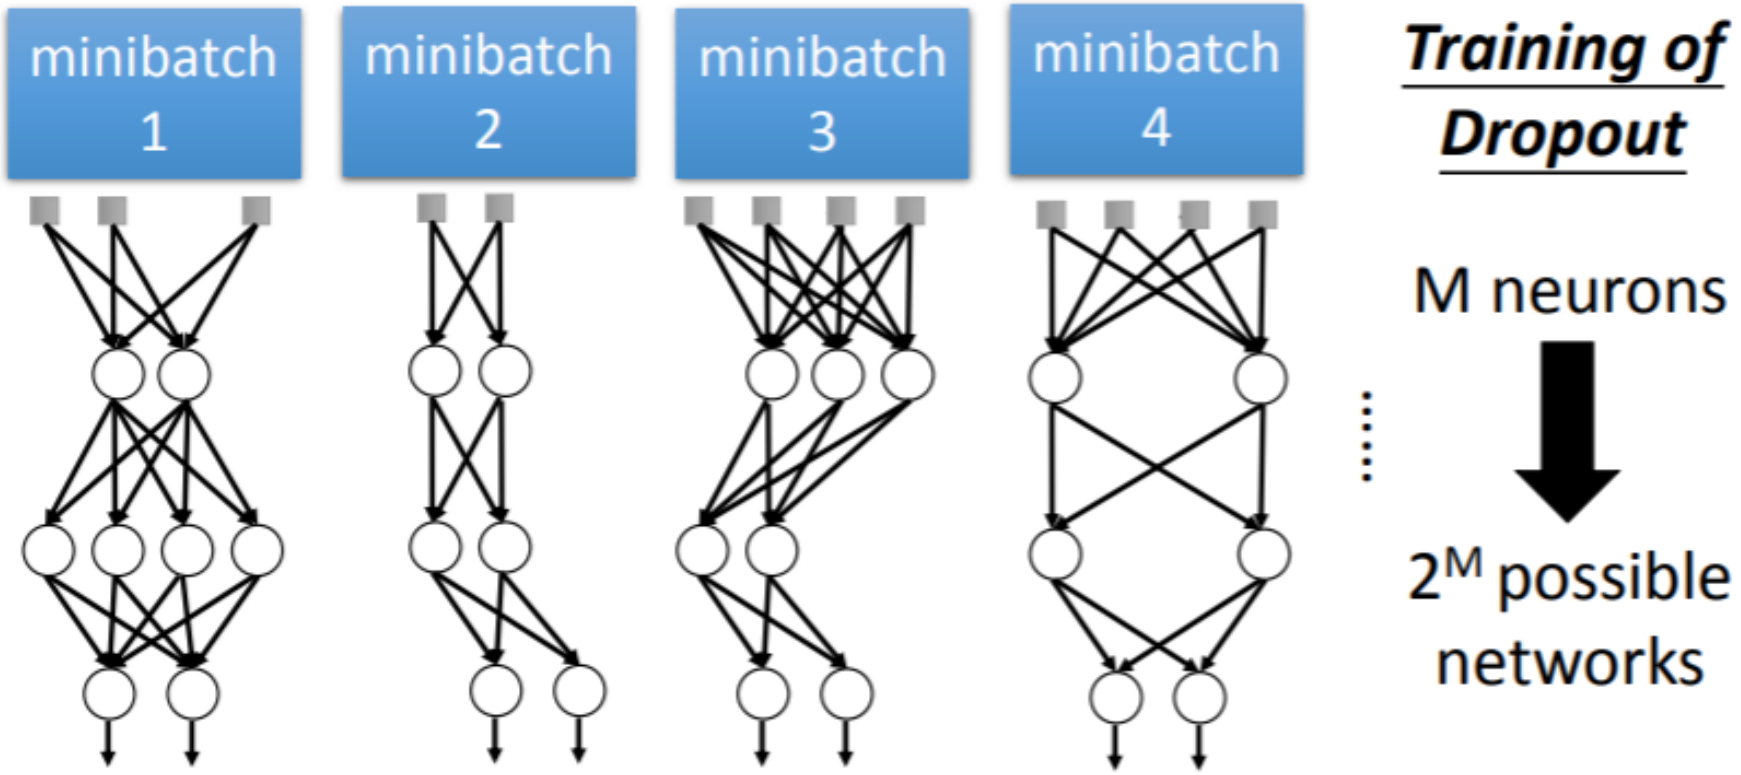
Drop out can be seen as an ensemble method.





Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

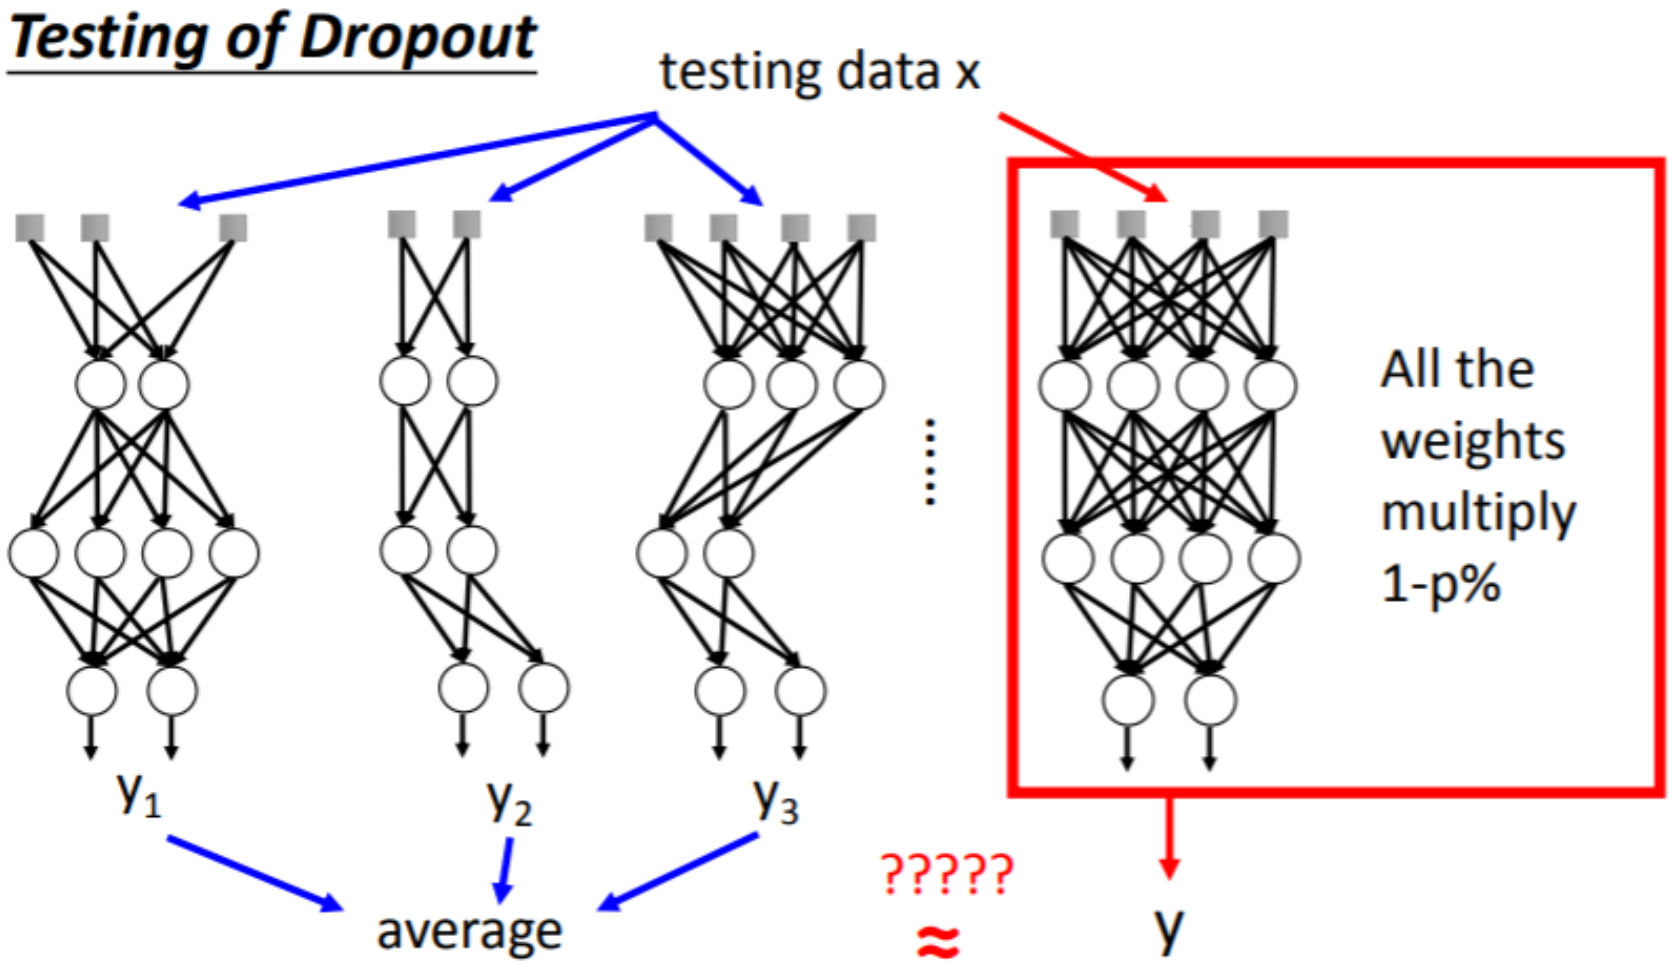
Why drop out makes NN performs better?



- Using one mini-batch to train one network
- Some parameters in the network are shared

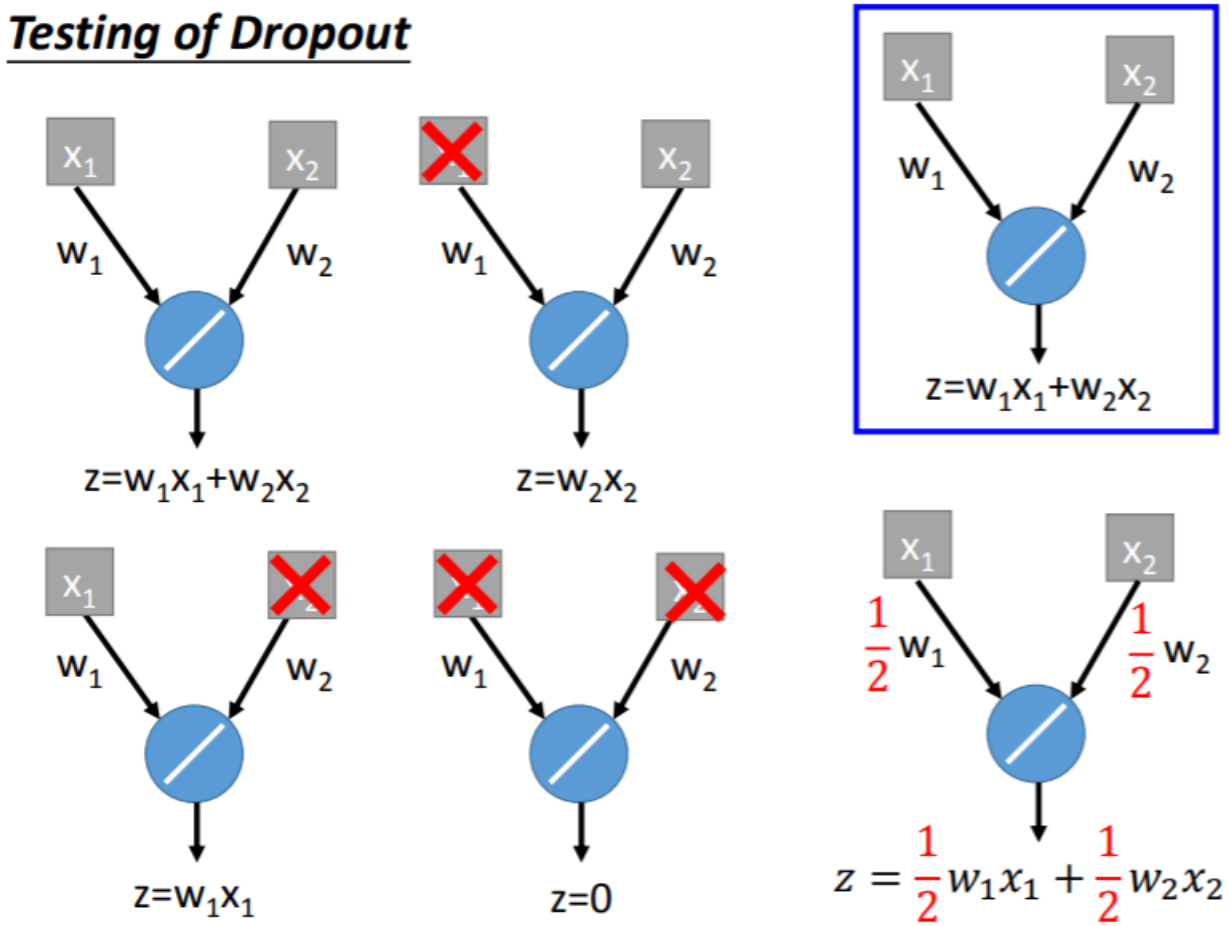
Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

Why multiply weights by (1-p)% during testing?



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

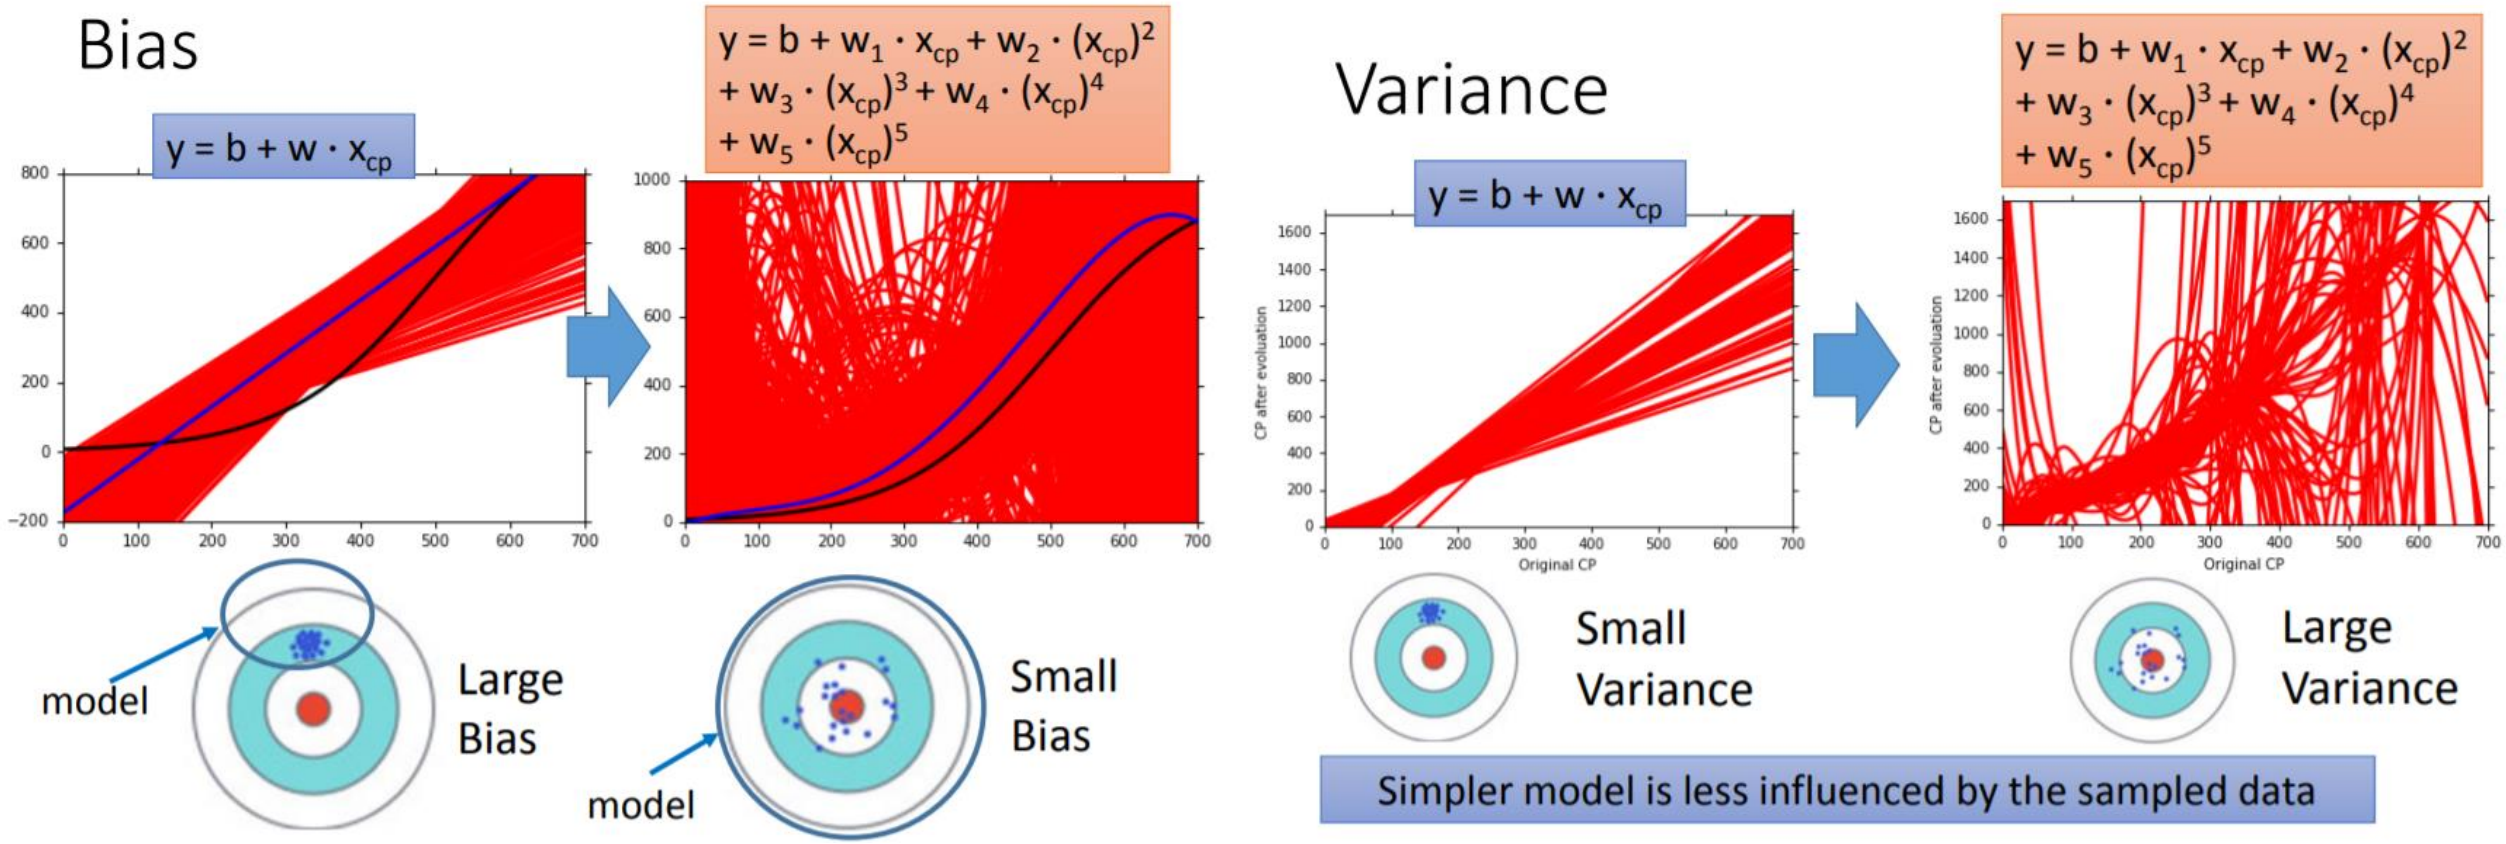
Why multiply weights by (1-p)% during testing?



Reference: 李弘毅 ML Lecture 9-1 https://youtu.be/xki61j7z-30

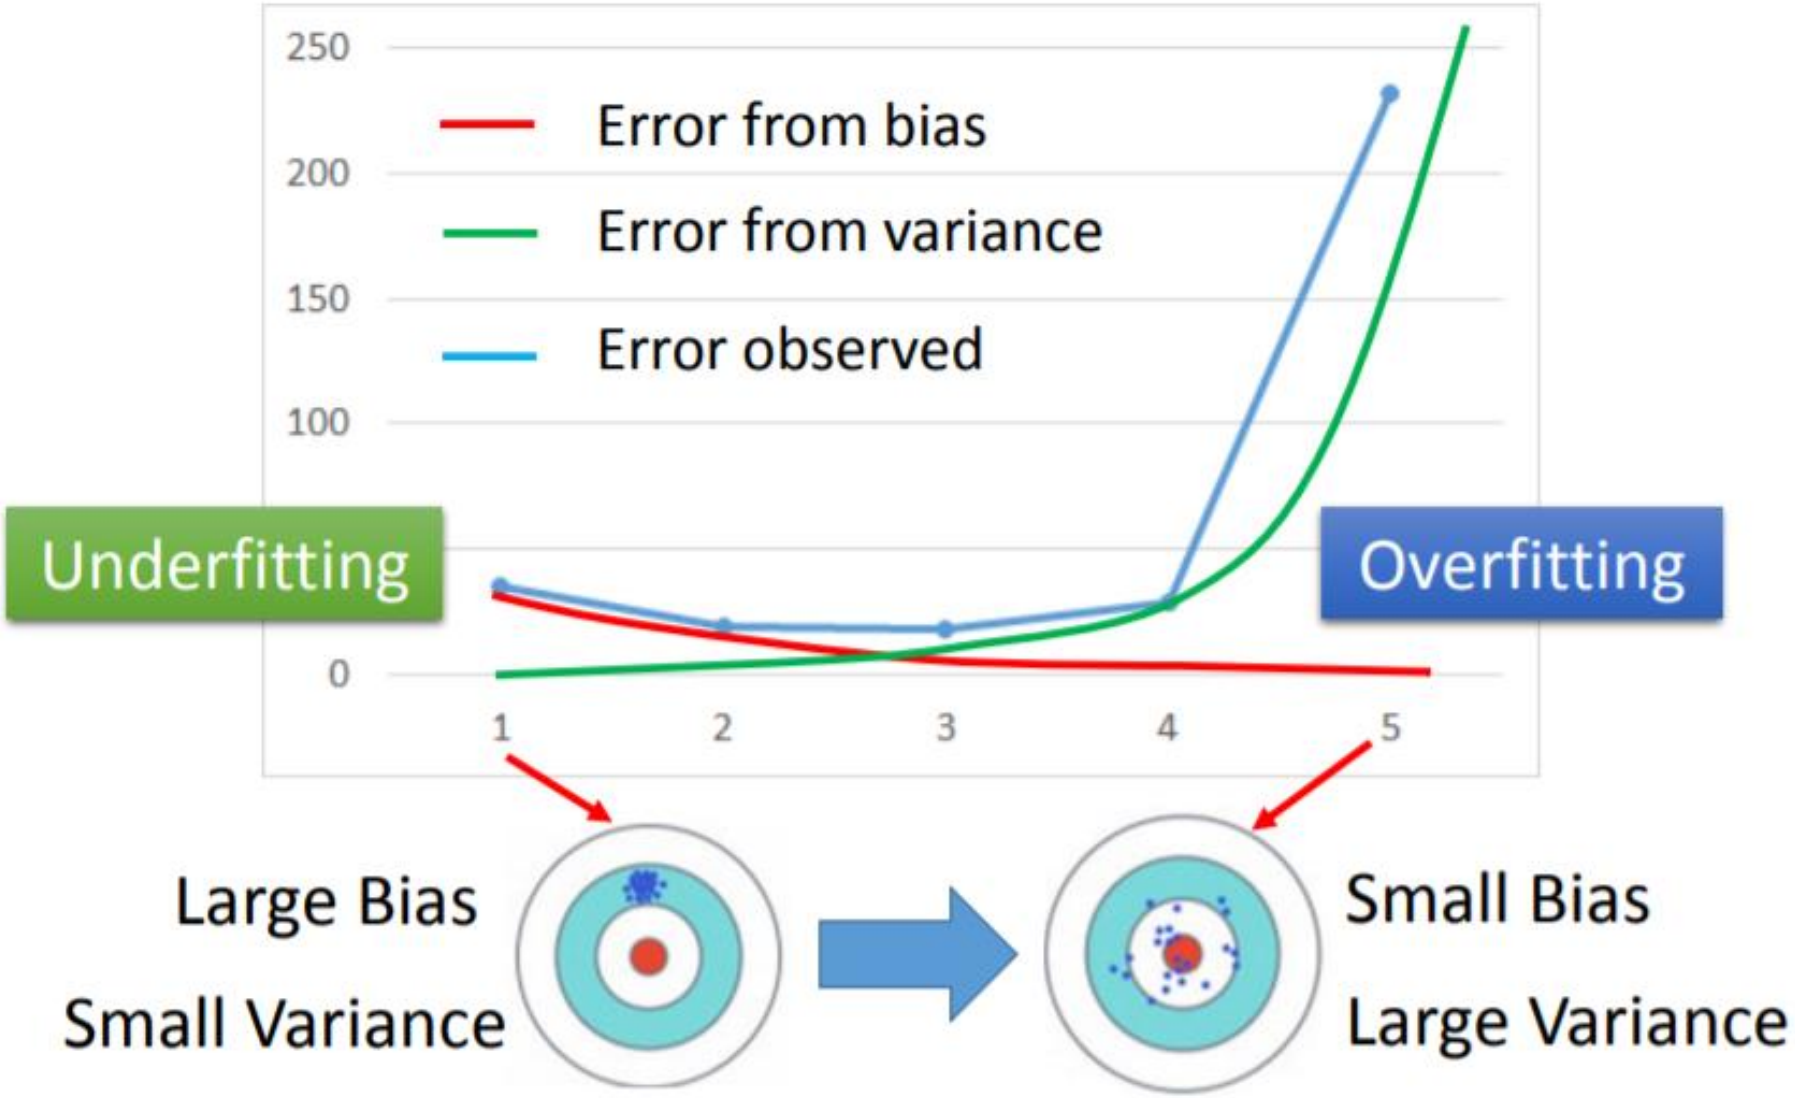
Report model's performance by bias and variance

Simpler model is less influenced by the sampled data and has smaller variance



Reference: 李弘毅 ML Lecture 2 https://youtu.be/D_S6y0Jm6dQ

Errors of ML model



Reference: 李弘毅 ML Lecture 2 https://youtu.be/D_S6y0Jm6dQ

Practice – Variance of model prediction errors

- Run “1. 2.4. Variance of predicting error.ipynb” .

HW3 (7)

- Based on HW3(2), show the box plot and discuss the bias and variance of the NN models.

		Box plot

Unstable model prediction performance due to overfitting

Predict ? times on randomly shuffled test data

No. of parameters		Box plot
11000	In between		Shallow & fat		Deep & thin	
500000	In between		Shallow & fat		Deep & thin	
Overfitting occurs when function to be learned is dominated by the random item

N=40, x=-100~100 step 5, y=3x+random(0,1)*200

Overfitting occurs when the function to be learned is regular but the *NN* design is exaggerated

N=40, x=-5000~5000 step 200

y=$3x^3 + 2x^2 + 5x$-random.uniform(0,1)*500

x, y normalized to [0, 1]

The function to be learned $y=f(x)$ is regular and NN design is normal

Why overfitting still occurs in this case? Is the result correct?

N=40, x=-5000~5000 step 250, y= cubic function of x
